Studies on environmental impact of the Terra Nova Bay Station began during the 1986/87 expedition and have been carried on in the following years. Airborne particulate matter has been sampled and analyzed; water treatment plant and incinerator monitoring were planned and performed at the Station. A review of the four year activity is presented; a noticeable increment in the elements V, Fe, Al and Mn occurred over this time. (Auth. mod.

Mittner, P., **Multielemental characterization of aerosol at Terra Nova Bay. Preliminary results of the fine component during the 1990-91 austral summer,** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.605-613, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 6 refs.

Aerosol sampling has been performed at Campo Icaro, in the vicinity of the Terra Nova Bay Station in the period between Nov. 1990 and Feb. 1991. The duration of the sampling intervals was approximately 12 hrs and a special aerosol sampler was used, with separation of the coarse and fine components. Aims and methods of the experiments are presented, as well as the results of a PIXE analysis of 89 samples of the fine component, collected on Nuclepore filters. Mean values and standard deviations of volume concentrations (ng/cu m) are given for the following elements: Si, S, Cl, K, Ca, Ti, Mn, Fe, Ni, Cu, and Zn. (Auth.)

Hughes, T.J., **Abrupt climatic change related to unstable ice-sheet dynamics: toward a new paradigm,** *Global and planetary change,* Mar. 1992 5(3), p.203-234, Refs. p.231-234.

In this paper, a new paradigm is postulated in which abrupt climatic change is driven by iceberg outbursts associated with life cycles of marine ice streams, and dust storms associated with life cycles of terrestrial ice streams. For Pleistocene Northern Hemisphere ice sheets, these mechanisms regulated North Atlantic surface temperatures and salinity, and perhaps planetary albedo and atmospheric CO2, and thereby drove climatic change, which tended to be abrupt because ice-stream life cycles began and ended abruptly. A portion of these ice sheets was subjected to the unstable life cycles of ice streams, as seen in the pronounced spikiness of the late glacial oxygen isotope stratigraphy in the Greenland ice core at Dye 3. Life cycles of Greenland ice streams during the Holocene seem to be linked to episodes of regional climatic cooling; most recently, the Little Ice Age. When superimposed on the present Milankovitch hemicycle of reduced insolation over the North Atlantic, this could abruptly initiate a new worldwide glaciation cycle in the aftermath of present-day CO2 "greenhouse" warming. Proliferation of antarctic ice-stream life cycles during the period of "greenhouse" warming may also trigger global climatic change by forcing a reorganization of circumpolar thermohaline circulation in the southern ocean. (Auth. mod.)

Smith, V.R., **Atmospheric carbon dioxide levels at Marion Island,** *South African journal of science,* Oct. 1991 87(10), p.535-536, 6 refs.

The Geophysical Monitoring for Climate Change (GMCC) division of NOAA has monitored atmospheric CO2 concentrations at a number of remote locations since 1968. One of the objectives of the monitoring program is to determine the magnitudes of sources, sinks and atmospheric transport of CO2 in order to improve estimates of the global atmospheric budget of this 'greenhouse' gas. This will allow better predictions of future trends in atmospheric CO2 levels and the possible climatic implications. Between 1982 and 1991, CO2 concentrations on the island increased on average by 1.2 ppm per year. Similar increases occurred at Macquarie I., *(ca.* 1.4 ppm/yr), Amsterdam I., *(ca.* 1.3 ppm/yr) and at Mawson *(ca.* 1.3 ppm/yr. At Palmer Station and the South Pole, annual increases in CO2 concentrations appear to have been greater *(ca.* 1.6-1.8 ppm), at least until 1982. Reported here for the first time are atmospheric CO2 concentrations measured at Marion I. on four occasions over the past 13 years. This represents a very scant data set for an area where there is a great need for information on atmospheric trace gas concentrations.

Pereira, E.B., Loureiro, A.L.M., Vasconsellos, M.B.V., **Reconnaissance of elemental composition in aerosols of the Antarctic Peninsula,** *Atmospheric environment,* June 1992 26A(8), p.1549-1550, 5 refs.

The composition of subantarctic aerosols, collected during 1986/1987 in the Brazilian coastal station Ferraz, is presented. The soil dust components Al and Mn were about 30 times larger than at the South Pole. Yearly averages of Al, Mn, Na, Cl and trace radon gas presented higher values during 1986 when higher winds prevailed. The trace metals Zn and Sb exhibited a clear seasonal trend with a minimum during winter. (Auth. mod.)

Peng, T.H., Broecker, W.S., **Factors limiting the reduction of atmospheric CO2 by iron fertilization,** *Limnology and oceanography,* Dec. 1991 36(8), p.1919-1927, 23 refs.

Details of an advection-diffusion model of the ocean-atmosphere system are outlined to show the parameters used in its construction. These include: *p*CO2, CO2 reduction, upwelling flux, vertical density, and gas exchange rate. The key parameters are the upwelling rate and the fate of upwelled water. The length of the productive season influences the extent of *p*CO2 reduction. For 8 months of productive fertilization this model yields a reduction of 60 micro atm, for 4 months a reduction of 50 micro atm, and for 2 months a reduction of 40 micro atm. The maximum O2 consumption in the standard case is estimated to be 133 micro mol/kg at a depth of 600 m. However, O2 consumption depends on the reoxidation function in the subsurface water. If the organic flux reoxidizes completely in the upper 2,000 m, the maximum consumption of O2 at 500 m could reach 500 micro mol/kg. Hence, depending on the reoxidation function, an anoxic antarctic thermocline could result from Fe fertilization. Both calculations regarding the seasonality of production and those regarding oxygen reduction are highly sensitive to parameters over which there is little control. They are included only to emphasize their potential importance. (Auth. mod.)

Lubin, D., Frederick, J.E., **Observations of ozone and cloud properties from NSF ultraviolet-monitor measurements at Palmer Station, Antarctica,** *Antarctic journal of the United States,* 1990 25(5), p.241-242, 2 refs.

The National Science Foundation scanning spectroradiometer at Palmer Station provides hourly ground-based measurements of solar ultraviolet irradiance. In addition to defining the ultraviolet radiation environment of the region, these measurements allow the derivation of the column density of atmospheric ozone above the station nearly every daylight hour. This hourly time resolution, not generally available from other methods of monitoring antarctic ozone abundances, enables the detection of large and rapid changes in total column ozone and ultraviolet surface irradiance associated with the dynamics of the polar vortex. In conjunction with a daily record of sky conditions and radiative transfer modeling, the ultraviolet-monitor measurements permit a quantitative understanding of the role of cloud cover in regulating ultraviolet radiation levels at the antarctic Earth surface.

Deshler, T., Hofmann, D.J., Hereford, J.V., Sutter, C.B., **Vertical profiles of ozone and aerosol at McMurdo Station, Antarctica in the spring of 1989,** *Antarctic journal of the United States,* 1990 25(5), p.243-244, 4 refs.

Ozone and temperature profiles were measured in 39 balloon flights at McMurdo Station from Aug. 23 to Oct. 30, 1989. Optical particle counters were included on 4 flights to measure condensation nuclei (radii=0.01 micron) and 5 flights to measure polar stratospheric cloud particles with the new high-flow-rate aerosol counter (radii=0.15 micron to 5.0 microns). In 1989, as in previous years, ozone depletion occurred in the 12-20 km layer, was episodic, occurring rapidly in two periods of less than 5 days, appeared to be tied to temperatures below -70 C, and recovered initially above 20 km with an influx of ozone-rich air from mid latitudes. A time history of ozone and temperature in the spring is shown in a figure for the years 1986-1989. Comparison of 1987 and 1989 suggests that only certain minimum meteorological conditions are required for chemical destruction of ozone to proceed to completion, and that prolonging those conditions would probably not lead to significant further depletion.

Rosen, J.M., Kjome, N.T., Oltmans, S.J., **Study of polar stratospheric clouds at the South Pole,** *Antarctic journal of the United States,* 1990 25(5), p.246, 2 refs.

A project centered on balloonborne measurements of polar stratospheric clouds and frost point in the nighttime stratosphere over Amundsen-Scott Station is described. During part of the year, satellite observations of polar stratospheric clouds are not available. The water-vapor measurements help identify the processes important in the formation of polar stratospheric clouds; in addition, they detail the dehydration of the antarctic stratosphere. The polar stratospheric cloud measurements are accompanied by simultaneous ozone measurements using the same instrument package and digital-data telemetry system.

I-46326

Hanson, K.J., **South Pole Station temperature chronology and the global warming problem,** *Antarctic journal of the United States,* 1990 25(5), p.247-249, 5 refs.

The 33 years of temperature observations at the Amundsen-Scott Station (1957-1989) have been used to determine monthly variability and "normals," as indicated in a figure and a table. The normals show that the warmest month is Dec. (-27.9 C) and the coldest month is July (-60.0 C). The chronology of the Station's annual average temperatures for the period 1957-1989 is given in a figure. There is no apparent warming over the 33-year period. The chronology shows unusually cold years in 1983 and 1987. For the purpose of obtaining temperature trend information for the South Pole, it would be useful to identify, and to the extent possible to remove, interannual-scale temperature anomalies. There are two meteorological variables that appear to account, in part, for the temperature anomalies of 1983 and 1987: wind speed and wind direction.

Stearns, C.R., Weidner, G.A., **Antarctic automatic weather stations: austral summer 1989-1990,** *Antarctic journal of the United States,* 1990 25(5), p.254-258, 6 refs.

The National Science Foundation's Division of Polar Programs places automatic weather station units in remote areas of Antarctica in support of meteorological research and operations. The automatic weather station data are collected by the ARGOS Data Collection System on board the National Oceanographic and Atmospheric Administration (NOAA) series of polar orbiting satellites. The basic units measure air temperature, wind speed, and wind direction at a nominal height of 3 m above the surface, and air pressure at the electronics enclosure. Some units may measure relative humidity at 3 m and the temperature difference between 3 m and 0.5 m above the surface. A table gives the ARGOS identification number, latitude, longitude, elevation, and the latest start date for antarctic automatic weather station units operating during 1990. Three figures show the locations for the units, units in the vicinity of the Reeves Glacier, and the units on the Ross Ice Shelf near Ross I., respectively. Some automatic weather station units are located in arrays for meteorological experiments and others for operational purposes.

Stearns, C.R., Weidner, G.A., **Wind speed events and wind direction at Pegasus site during 1989,** *Antarctic journal of the United States,* 1990 25(5), p.258-262, 3 refs.

On Jan. 22, 1989, an automatic weather station unit (Pegasus site) was installed on the Ross Ice Shelf between the ice shelf edge and White and Black islands at the blue ice region being considered for an aircraft runway. The purpose of the weather station unit was to monitor the meteorology of the blue ice region to find out if the site is satisfactory for aircraft operations. Tabulated data are presented showing the mean temperature, mean wind speed, maximum temperature, and maximum wind speed for Pegasus and nearby automatic weather station units. The average wind speed is 0.9 m/s less at Pegasus site than at Ferrell site. The big difference between Ferrell and Pegasus sites is in the maximum wind speed for each month. The average maximum wind speed for the period Feb. through Oct. 1989 is 7.3 m/s higher at Pegasus site than at Ferrell site.

Parish, T.R., Bromwich, D.H., **Numerical simulation of the katabatic wind circulation over the antarctic continent,** *Antarctic journal of the United States,* 1990 25(5), p.262-264, 8 refs.

Numerical experiments have been made to address the development of the katabatic wind circulation over the antarctic continent and to assess the relationship between the katabatic wind regime and the circumpolar vortex. A three-dimensional version of the numerical model described in Parish and Waight (1987) was used in this study of antarctic surface winds. To isolate the katabatic wind influence, the model was initiated about a state of rest with no synoptic-scale wind systems present. A parameterized form of radiation was used to drive the model; the model equations were integrated for a 48 hour period. The pattern of katabatic wind speed over the entire continent after the 48 hour time integration is shown in a figure. To illustrate the development of the circumpolar vortex, the 500- and 250 hectopascal geopotential height field was computed regularly during the course of the model integration. The geopotential height patterns at the 500- and 250 hectopascal levels after the model integration period of 48 hours are shown in a figure.

Anderson, P.S., **Microbarograph for internal gravity wave studies in Antarctica,** *Antarctic science,* June 1992 4(2), p.241-248, 23 refs.

Measurement of pressure fluctuations provides the best means of detecting atmospheric internal gravity waves at the Earth surface. An instrument was developed which is sufficiently sensitive to detect the small pressure fluctuations associated with such waves, yet robust enough for deployment in an antarctic environment. The instrument incorporates several novel features, both in its design and in the method of deployment used. A prototype instrument has been successfully deployed at the British Antarctic Survey's Halley Station during 1989. The design of an experiment using an array of six improved instruments is briefly described. (Auth.)

King, A.W., Emanuel, W.R., Post, W.M., **Projecting future concentrations of atmospheric CO2 with global carbon cycle models: the importance of simulating historical changes,** *Environmental management,* Jan./Feb. 1992 16(1), p.91-108, Refs. p.105-108.

Projections of future atmospheric CO2 concentrations using global carbon cycle models and assumed time series of future anthropogenic CO2 emissions are only useful if simulations agree reasonably well with the observed history of past changes in atmospheric CO2. In this article simulations from a set of eight global carbon cycle models are compared with observations of atmospheric CO2 from the Siple Station ice core and the monitoring station at Mauna Loa Observatory, HI, USA. The comparisons reinforce previous assessments that early estimates of biospheric CO2 emissions derived by reconstruction of historical land-use change are incompatible with the understanding of atmosphere-ocean CO2 exchange codified in conventional carbon cycle models and the observed history of changes in atmospheric CO2. More recent estimates of the history of CO2 emissions associated with land-use change do not significantly resolve this incompatibility. Terrestrial biospheric emissions estimated by deconvolution of atmospheric CO2 observations provide reasonable correspondence between simulation and observation, but the deconvolution estimates differ dramatically from the estimates by land-use reconstruction. Resolution of this difference is a challenge for modelers of the global terrestrial biosphere. In the interim, caution is required in interpreting atmospheric CO2 projections from models that have not yet resolved the basic inconsistencies among emission estimates, models of oceanic uptake, and observations of atmospheric CO2. Egger, J., **Topographic wave modification and the angular momentum balance of the antarctic troposphere,** *Journal of the atmospheric sciences,* Feb. 15, 1992 49(4), p.327-334, 11 refs.

A shallow inversion layer with southeasterly outflow and a cyclonic vortex in the troposphere are the basic characteristics of the antarctic mean circulation. An attempt is made to model this pattern in a two-layer representation of the atmosphere where all equations are averaged horizontally over the antarctic domain. Cooling at the slope drives a direct circulation that acts as a source of westerly angular momentum. This momentum is transferred out of Antarctica by topographically modified large-scale waves, enforced at the northern boundary of the model. Two types of steady states are found for fixed frequency and zonal wavenumber: one where the wave is quite effective in performing the required momentum transport so that a qualitatively realistic circulation results, and another one with strong upper-level westerlies but virtually no surface easterlies. A model climatology can be derived if stochastic forcing is added to the equations. It turns out that the distribution of the flow states is centered near a "realistic" equilibrium if a wave spectrum is prescribed at the northern boundary according to observations. (Auth.)

Smith, R.C., Wan, Z.M., Baker, K.S., **Ozone depletion in Antarctica: modeling its effect on solar UV irradiance under clear-sky conditions,** *Journal of geophysical research,* May 15, 1992 97(C5), p.7383-7397, Refs. p.7395-7397.

Radiative transfer numerical simulations have been made for quantitatively analyzing the effect of ozone depletion on solar irradiance at the Earth's surface in the UV and visible ranges. Simulations show that the ozone's temperature-dependent absorption and atmospheric multiple scattering play important roles in the UV region. By means of sensitivity analyses, the level of surface UV-B irradiance under clear-sky conditions is shown to depend, with a decreasing significance, on solar zenith angle, total column ozone, surface spectral reflectivity, stratospheric temperature, and aerosol variations. The simulation results are compared with the National Science Foundation (NSF)/UV spectroradiometer data obtained at Palmer Station and the Total Ozone Mapping Spectrometer (TOMS) satellite data. In general, the model and data show good agreement, especially in the UV region. Based on simulation results, a UV irradiance ratio method to estimate total column ozone from the NSF/UV spectroradiometer using clear- sky data obtained during the austral spring of 1988 and 1990 is developed. A method for estimating surface UV-B from TOMS satellite data is also developed. (Auth. mod.)

I-46430
Gaudichet, A., **Comments on the origin of dust in East Antarctica for present and ice age conditions,** *Journal of atmospheric chemistry,* Apr. 1992 14(1-4), p.129-142, 23 refs.

In this paper, the distribution of 327 clay mineral particles retrieved from four antarctic ice samples corresponding to present and Last Glacial Maximum (LGM) climate conditions were studied. Illite, chlorite, smectite and kaolinite were identified in all samples. Focusing on kaolinite, because of its use as a possible tracer of low latitude soils, a significantly smaller amount for LGM samples was found, while the dust concentration in snow during the LGM was about 30 times higher than for present climate conditions. This can be interpreted as change in the contribution of the Australian source with climate. A second approach was based on the modeling of the desert dust cycle using an Atmospheric General Circulation Model (AGCM) under both present-day and ice age conditions. Unlike mineralogical results, the model suggests the prevalence of the Australian dust source in the deposits over East Antarctica under both present-day and LGM climate conditions. However the model fails to reproduce the strong increase in dust deposits during the LGM. This discrepancy could be partly due to the lack of a higher latitude dust source in the model. The stronger dust input recorded in ice cores for the LGM could be related to an additional active high latitude source (possibly close to South America) overlapping the atmospheric background coming from low latitude areas. (Auth. mod.)

Savoie, D.L., Prospero, J.M., Larsen, R.J., Saltzman, E.S., **Nitrogen and sulfur species in aerosols at Mawson, Antarctica, and their relationship to natural radionuclides,** *Journal of atmospheric chemistry,* Apr. 1992 14(1-4), p.181-204, Refs. p.202-204.

High volume aerosol samples were collected continuously at Mawson Station from Feb. 1987 through Oct. 1989. All samples were analyzed for Na+, Cl-, SO4=, NO3-, methanesulfonate (MSA), NH4+, Be-7, and Pb-210. The annual mean concentrations of many of the species are substantially lower than even those over the relatively pristine regions of the tropical and subtropical South Pacific. The concentrations at Mawson are comparable both in magnitude and in seasonality to those which have been measured in long term studies at the South Pole and at the coastal German antarctic research station, Georg von Neumayer. This comparability suggests that the aerosol composition may be relatively uniform over a broad sector of the Antarctic. The concentrations of most of the species exhibit very strong and sharply-defined seasonal cycles. These results indicate that the major source of NO3- over Antarctica is probably of continental as opposed to stratospheric or marine biogenic origin. (Auth. mod.)

De Angelis, M., Barkov, N.I., Petrov, V.N., **Sources of continental dust over Antarctica during the last glacial cycle,** *Journal of atmospheric chemistry,* Apr. 1992 14(1-4), p.233-244, 18 refs.

The soluble and insoluble parts of 4 major components (Al, Ca, K and Mg) of the continental dust input over East Antarctica, as well as size distribution parameters of the insoluble part of this dust, have been studied along an ice core which spans the last climatic cycle (160 kyr). These results provide a better understanding of the respective impact of the different potential dust sources. While Al and K were probably entrapped in illite originating from arid areas and in a lesser extent from shallow marine sediments, Ca and Mg inputs were dominated by marine carbonate of exposed continental shelves emissions. (Auth.)

I-46435
Delmas, R.J., **Free tropospheric reservoir of natural sulfate,** *Journal of atmospheric chemistry,* Apr. 1992 14(1-4), p.261-271, 41 refs.

Be-10 is used as a spike of the natural background atmospheric aerosol to calculate the global flux of sulfur (Fs) into the free troposphere. The sulfate and Be-10 concentrations determined in polar snow are compared. On the basis of an annual Be-10 production rate of 1.21 10 million at./sq cm, a very low figure of 2.9 Tg S/a is calculated for Fs, which suggests that most of the sulfur emitted at ground level remains in the boundary layer. The role of carbonylsulfide in the upper tropospheric sulfur budget is reviewed. It is also shown that cataclysmic volcanic eruptions may disturb considerably for 1-2 years this vast background tropospheric sulfur reservoir. Three antarctic sites were among sources of ice cores for analysis of snow chemistry. (Auth. mod.)

Bian, L., Lu, L., Jia, P., **Radiation data at Zhongshan Station, Antarctica, from Feb. 1990 to Jan. 1991,** *CHINARE data report,* Dec. 1991 No.4, 121p., In Chinese with English summary.

Radiation and micrometeorological observations, using a 32 m tower at Zhongshan Station, were carried out as part of the CHINARE-VI program from Feb. 12, 1990, to Jan. 31, 1991. The structure of the atmospheric boundary layer and the heat balance components near the surface were studied. The hourly mean values of global, reflected, net, and effective radiation, and hourly mean albedo, are presented in tables.

I-46445
Bian, L., Lu, L., Jia, P., **Observational study of radiation balance components over Larsemann Hills,** *Antarctic research (Chinese edition),* Dec. 1991 3(4), p.42-53, In Chinese with English summary. 9 refs.

A project to obtain continuous measurements of surface radiation balance components was carried out at Zhongshan Station from Feb. 1990 to Jan. 1991. A micro-computer sampling system was used, with pyranometers measuring the radiation flux, including direct solar radiation and global, reflected, and net radiation (0.3-30 microns). These values were sampled digitally and recorded every minute at 1.5 m above the surface. Results are shown in tables and are summarized as follows: the annual mean value of the global radiation is 119.2 W/sq m, about 90% of which is obtained during Oct.-Mar. The annual mean albedo is 0.42, and it varies significantly from day to day. The annual mean value of net radiation is 11.7 W/sq m. The mean value of the net radiation is positive (64.1 W/sq m) from Oct. to Mar., and negative (-40.6 W/sq m) the rest of the year. (Auth. mod.)

Sloan, L.C., **Possible methane-induced polar warming in the early Eocene,** *Nature,* May 28, 1992 357(6376), p.320-321, 7 refs.

Reconstructions of early Eocene climate depict a world in which the polar environments support mammals and reptiles, deciduous forests, warm oceans and rare frost conditions. At the same time, tropical sea surface temperatures are interpreted to have been the same as or slightly cooler than present values. The question of how to warm polar regions of Earth without noticeably warming the tropics remains unresolved; increased amounts of greenhouse gases would be expected to warm all latitudes equally. Oceanic heat transport has been postulated as a mechanism for heating high latitudes, but it is difficult to explain the dynamics that would achieve this. Considered here are estimates of Eocene wetland areas, and it is suggested that the flux of methane, an important greenhouse gas, may have been substantially greater during the Eocene than at present. Elevated methane concentrations would have enhanced early Eocene global warming, and also might specifically have prevented severe winter cooling of polar regions because of the potential of atmospheric methane to promote the formation of optically thick, polar stratospheric ice clouds. (Auth. mod.)

Dickey, J.O., Marcus, S.L., Hide, R., **Global propagation of interannual fluctuations in atmospheric angular momentum,** *Nature,* June 11, 1992 357(6378), p.484-488, 18 refs.

The El Niño Southern Oscillation (ENSO), a climate fluctuation that recurs on a 2-7 yr timescale, is associated with persistent large-scale fluctuations in the dynamical behavior of the global atmosphere-ocean system. A study is presented of the latitudinal redistribution of angular momentum within the atmosphere from 1976 to 1991. This reveals a slow, global-scale, coherent, poleward propagation of atmospheric angular-momentum fluctuations on interannual timescales. These originate in equatorial regions, where they lead the main atmospheric anomalies of the ENSO cycle by nearly two years; they penetrate to latitudes higher than 60 deg in both hemispheres, where they lag behind the ENSO cycle by about 4 years. Also distinguishable is the bimodality of the ENSO phenomenon, with a low-frequency component centered at a period close to 4.2 years and a high-frequency component centered near 2.4 years. Each of the two components has a distinct latitudinal propagation pattern. In the period studied, strong El Niño and related La Niña climatic events occur when these components add constructively. (Auth. mod.)

Leuenberger, M., Siegenthaler, U., Langway, C.C., **Carbon isotope composition of atmospheric CO2 during the last ice age from an antarctic ice core,** *Nature,* June 11, 1992 357(6378), p.488-490, 35 refs.

Bubbles of ancient air in polar ice cores have revealed that the atmospheric concentration of CO2 during the Last Glacial Maximum was 180-200 p.p.m.v., substantially lower than the pre-industrial value of about 280 p.p.m.v. It is generally thought that this reduction in atmospheric CO2 during glacial time was driven by oceanic processes. The most likely explanations invoke either a decrease in dissolved CO2 in surface waters because of a more efficient 'biological pump' transporting carbon to deep waters, or a higher alkalinity in the glacial ocean as a consequence of changes in carbonate dissolution or sedimentation. Because isotope fractionation during photosynthesis depletes C-13 in the organic matter produced, changes in the biological pump would alter the carbon isotope composition of atmospheric CO2, whereas changes in alkalinity would in themselves have no such effect. Reported here are measurements of the carbon isotope content of CO2 in ice cores from Byrd Station in an attempt to distinguish between these mechanisms. During the ice age the reduced isotope ratio *delta*C-13 was more negative than pre-industrial values by 0.3 per mill. Although this result does not allow a definite discrimination between the two possible causes of lower glacial atmospheric CO2, it does indicate that changes in the strength of the biological pump cannot alone have been responsible. (Auth. mod.)

Lin, N.H., Saxena, V.K., **Characteristics of antarctic stratospheric aerosols during the 1987 ozone depletion episode based on SAGE II satellite observations,** *Journal of geophysical research,* May 20, 1992 97(D7), p.7635-7649, 69 refs.

In this study, features of antarctic stratospheric aerosols during the ozone depletion episode of Oct. 1987 are investigated based on the SAGE II (Stratospheric Aerosol and Gas Experiment II) data. The study focuses on (1) inferring the aerosol size spectrum using a modified randomized minimization search technique and (2) investigating the vertical, zonal, and columnar averages of aerosol properties such as extinction coefficient, optical depth, mean and effective radii, mass loading, total number concentration, and surface area concentration, together with the ozone concentration. On the average, in the region below 18 km, maximum values for the parameters of mass loading, total number, and surface area concentration were found to be located just above the region of the most severe ozone depletion. As to the columnar aerosol properties, a bimodal feature in the size distribution is found during the days when the peak values of optical depth are greater than .001. Relatively abundant population of smaller particles is associated with the region of severe ozone depletion. The distinct latitudinal gradients of these aerosol parameters suggest that the stratospheric aerosols are separated into two regimes near 62-63S, probably as a result of the dynamics introduced by polar vortex. Smaller and larger particles dominate at higher and lower latitudes, respectively. The average amount is about 95 DU (Dobson units) with the amplification of about 48 DU. It is pointed out that the reported features of the stratospheric aerosols in the antarctic region are useful in providing insights into the mechanisms for ozone depletion. (Auth. mod.)

Gruzdev, A.N., **Peculiarities of polar ozone annual course: analysis of satellite and ozonesonde data and model results,** *Norsk geologisk tidsskrift,* Oct. 1991 71(3), Climate of the northern latitudes: past, present and future. Edited by M. Hald, et al, p.183-187, 11 refs.

The following analysis demonstrates certain space-time structures in the annual evolution of the ozone field. Latitude-altitude features of the ozone annual cycle in different layers of the stratosphere and troposphere, in the northern and southern hemispheres (NH and SH) at middle latitudes are compared with those in polar latitudes. There are differences in principle in ozone space-time dynamics in the northern and southern polar regions, particularly in connection with stratospheric-tropospheric exchange, boundary-layer ozone, and the possible creation of ozone 'holes'. Reed, M.R., Stewart, M., **U.S. Naval Support Force, Antarctica: weather operations 1989-1990,** *Antarctic journal of the United States,* 1990 25(5), p.296-297.

The U.S. Antarctic Program's all-Navy weather staff uses a unique polar orbiting satellite system developed specifically for Operation DEEP FREEZE by the Scripps Institution of Oceanography in La Jolla, CA. Four times daily, the system (called GODDESS) relays satellite images from McMurdo to the Antarctic Research Center at Scripps for recording in the archives there. All weather observations from U.S. Antarctic Program reporting stations are forwarded to McMurdo Station. These reports are rebroadcast via high-frequency teletype to Christchurch, New Zealand, where they are inserted into the New Zealand Meteorological data circuit. From Christchurch the data is sent to Wellington, New Zealand, put into the World Meteorological Organization's data stream and made available to all potential users.

Gallée, H., Schayes, G., **Dynamical aspects of katabatic wind evolution in the antarctic coastal zone,** *Boundary-layer meteorology,* Apr. 1992 59(1-2), p.141-161, 33 refs.

The spatial evolution of katabatic winds along idealized slopes representative of antarctic terrain is examined, using a hydrostatic, two-dimensional primitive equation model with high resolution. A downslope momentum-forces analysis is made of simulations in which katabatic flow reaches steady state, with emphasis on physical mechanisms in the coastal zone. The importance of the reversal of the pressure gradient force in the coastal zone, causing the sudden decay of katabatic winds, is discussed. (Auth.)

Iwasaka, Y., **Chemical state of polar stratospheric aerosols,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.1-8, 19 refs.

The possibility that particles containing nitric acid form above the background sulfate particle layer in the winter arctic stratosphere is discussed. External mixing of nitric acid and sulfate particles was observed in the region of 18.8-19.6 km (the upper part of the sulfate particle layer) during the measurements of Jan. 31, 1990. One possible explanation of this phenomenon is sedimentation of the nitric acid particles, which could be an important process causing denitrification of the polar stratosphere and polar ozone depletion. A high aerosol layer is frequently observed in early winter at Showa Station, believed to be due to formation of nitrate particles above the sulfate aerosol layer. (Auth. mod.)

Yamazaki, K., Chiba, M., **Transport simulation of passive tracers from the Northern Hemisphere to the Southern Hemisphere,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.9-23, 22 refs.

In order to study the transport process of anthropogenic gases such as CO2 and halocarbons, transport simulations were performed for passive tracers emitted from various regions from Dec. 1 to mid-Oct. It is found that large gradients (tracer front) formed near the equator at low levels in all the Northern Hemisphere (NH) cases. In the Southern Hemisphere (SH), tracer density increases with height in the troposphere in all cases. The above features are related to the inter-hemispheric transport. From the NH, tracers spread into the equator through the lower layer, move upward over the equator and are transported through the upper troposphere into the SH. The above results imply that transport accounts for the observed latitudinal and vertical distribution of CO2 and halocarbons, in addition to source/-sink effect. It is suggested that the tracer density in the antarctic stratosphere is extremely low, but would be expected to increase if the calculations were continued until the austral summer. (Auth. mod.)

Kanzawa, H., **Proposal for observation of atmospheric circulation and transport processes in the troposphere and lower stratosphere over Antarctica with a network of wind profilers,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.29-38, 23 refs.

A plan for installing wind profilers at several points over Antarctica is proposed. Observations with a network of the wind profilers at several sites will give useful information on meridional circulation in the troposphere and lower stratosphere, on vertical motion around the tropopause whose altitude over Antarctica is around 10 km, and on disturbances such as convection, gravity waves, baroclinic waves, etc. Observations are also useful for understanding how, when, and how much ozone, water vapor, and other materials are transported from the stratosphere to the troposphere, and thence to the antarctic surface or the middle latitude troposphere. Problems to be overcome for realizing the project are also briefly discussed. (Auth. mod.)

Masuko, H., Ochiai, S., **Development of short-millimeter and sub-millimeter wave radiometer/spectrometer system for observing ozone and trace gases in the upper atmosphere,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.39-55, 15 refs.

A radiometer/spectrometer system operating in the millimeter and sub-millimeter wave range is the most promising method to remotely observe upper atmospheric ozone and other trace gases, making it possible to monitor the vertical profiles of trace gases from the ground. Limb emission observation from space makes it possible to globally estimate the three-dimensional distributions of trace gases. Communications Research Laboratory (CRL) has started to develop a ground-based system operating in the short-millimeter wave range. It is also planned to develop a balloon-borne system, which is necessary for basic estimation of the satellite-borne system and its data analysis. In this report, the authors present the plan of CRL, together with the results of the feasibility study for developing these systems. (Auth. mod.)

Aoki, S., Nakazawa, T., Murayama, S., Kawaguchi, S., **Precise measurements of atmospheric methane concentration at Syowa Station (69S, 39.6E), Antarctica,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.56-65, 16 refs.

Precise measurements of atmospheric CH4 concentration were initiated at Showa Station in Feb. 1988. A regular diurnal variation is not observable, but irregular variations are sometimes observed with extremely small amplitude of 5 ppbv at most. A seasonal variation is clearly seen with an amplitude of 30 ppbv. Annual mean values of CH4 concentration were 1640 and 1651 ppbv for 1988 and 1989, respectively. (Auth.)

Aoki, S., **Atmospheric carbon dioxide measurements at Syowa Station, Antarctica, 1984-1988,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.66-75, 22 refs.

Precise and continuous measurements of atmospheric CO2 concentration have been continued at Showa Station since Feb. 1984. Diurnal CO2 variation was hardly observable throughout the year. The secular CO2 trend was variable with time, showing a slow increase in 1984, 1986 and 1988 and rapid increase in 1985 and 1987. The annual CO2 increase was notable, especially in 1987, which may be related to the 1987 ENSO event. The average rate of annual CO2 increase over the last 5 years was about 1.6 ppmv/yr. The average seasonal CO2 cycle showed minimum and maximum concentrations in mid-Apr. and in early Oct., respectively. Its peak-to-peak amplitude was about 1.1 ppmv for the period 1984-1988. The seasonal cycle was variable from year to year, but there was no indication of long-term amplitude increase. It was found that irregular CO2 variations with amplitudes of about 0.2 ppmv have high correlation with air mass exchange by synoptic scale weather disturbances. (Auth.)

Aoki, T., Yamanouchi, T., **Cloud-radiative forcing over the snow-covered surface around Asuka Station, Antarctica,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.76-89, 13 refs.

Cloud-radiative forcing at the snow-covered surface in Antarctica was estimated from data of the radiation budget observation at Asuka Station in 1988. Cloud-radiative forcing at the top of the atmosphere was also estimated from satellite data in Dec. 1988. It was found that shortwave forcing was negative (cooling) at the surface and positive (heating) at the top of the atmosphere. The longwave forcing was positive both at the surface and at the top of the atmosphere. The (shortwave+longwave) forcing was positive both at the surface and at the top of the atmosphere. The shortwave forcing was positive over the snow-covered region except the high inland, and negative over the seas. The longwave forcing was positive over all regions. The (shortwave+longwave) forcing was positive over the snow-covered regions except the high inland plateau, and negative over the sea. (Auth. mod.)

Enomoto, H., Ohmura, A., **Open water and circumpolar trough in the Antarctic,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.104-112, 28 refs.

The extent of open water area in spring and the time of rapid retreat of the sea ice area in late spring are important characteristics of sea ice in the Antarctic. The present study investigates relationships between atmospheric conditions and open water extent. In this study, the position and intensity of the circumpolar trough are used as a measure of atmospheric conditions over the sea ice. When the circumpolar trough is intense, it tends to be located at higher latitudes along the antarctic coast. In such cases, the open water in spring increases and the time of significant retreat of the sea ice edge in late spring tends to be delayed. (Auth.)

Yamanouchi, T., Oshiyama, T., Wada, M., **Analysis of MOS-1 MSR data received at Syowa Station, Antarctica,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.156-166, 14 refs.

Atmospheric parameters and ground surface information are obtained using the MOS-1 MSR data received at Showa Station. Several difficulties have appeared in the process of deriving water vapor amount and liquid water content. One is the antenna temperature, which includes large bias error; this causes the largest uncertainty. Also, the antenna temperature near the coast of the antarctic continent was greatly affected by high brightness temperature of the ice sheet owing to the antenna side lobe, which caused difficulties in comparing with ground- based observations as a validation. In the normal condition, for the present example, water vapor amount ranged from 0.4 to 1.4 g/sq cm and liquid water content from 0 to 14 mg/sq cm. However, there was found a band of high liquid water content in some paths, corresponding to a high brightness temperature of about 190 K. Atmospheric water vapor or liquid water affects the estimation of surface conditions such as sea ice concentration. It is difficult to obtain atmospheric parameters over the ice sheet and sea ice, on account of their high and variable brightness temperature. (Auth.)

Seko, K., **Preliminary study of katabatic wind by using NOAA AVHRR data,** NIPR Symposium on Polar Meteorology and Glaciology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.167-173, 14 refs.

The behavior of katabatic winds on the antarctic ice sheet can be monitored from NOAA AVHRR data. Katabatic wind is observed as fluctuations of brightness temperature on the thermal infrared channel. The structure of the fluctuation reveals a well-defined streak feature. Wind direction and wind speed can be monitored from the satellite images. The fluctuation of brightness temperature is probably caused by fluctuation in wind velocity. (Auth.)

Geller, M.A., Nash, E.R., Wu, M.F., Rosenfield, J.E., **Residual circulations calculated from satellite data: their relations to observed temperature and ozone distributions,** *Journal of the atmospheric sciences,* July 1, 1992 49(13), p.1127-1137, 20 refs.

Monthly mean residual circulations were calculated from eight years of satellite data. The diabatic circulation is usually found to give a good approximation to the residual circulation, but this is not always the case. In particular, an example is shown at 60S and 30 mb where the diabatic and residual circulations show very different annual variations. Correlations between the vertical component of the residual circulation and temperature and ozone indicate that yearly variations of temperatures at higher latitudes are under radiative control, except during stratospheric warmings. A one to two month phase lag is seen in the annual variation in the total ozone at 60N with respect to the maximum downward residual motions. This phase lag is greater at 60N than at 60S. There is evidence at 60S of a greater downward trend in the mean zonal ozone maxima than there is in the minima. A decreasing trend in the maximum descending motion is seen to accompany the ozone trend at 60S. (Auth. mod.)

Rees, J.M., **On the characteristics of eddies in the stable atmospheric boundary layer,** *Boundary-layer meteorology,* June 1991 55(4), p.325-343, 24 refs.

A discussion of the cross-spectral properties of eddies in the lowest 40 m of the nocturnal boundary layer is presented. The study involves the analysis of meteorological data collected at Halley Station during the austral winter of 1986. Cross-spectral analysis is used to determine whether the nature of the observed eddies is primarily turbulent or whether their structure is characteristic of coherent internal gravity waves. It is found that the cross-spectral phases indicate the presence of turbulent eddies only when the local gradient Richardson number (Ri) is less than the critical value of 1/4. Trapped modes were only observed when an offshore wind prevailed, indicating that topographic effects are responsible for their generation. The relative phases of velocity and temperature were often observed to change with height. This can be explained by examining the underlying meteorological conditions. On several occasions, regions of counter-gradient fluxes were detected. A physical explanation of this phenomenon is proposed. (Auth.)

Koster, R.D., Jouzel, J., Suozzo, R.J., Russell, G.L., **Origin of July antarctic precipitation and its influence on deuterium content: a GCM analysis,** *Climate dynamics,* June 1992 7(4), p.195-203, 27 refs.

The NASA/GISS GCM (general circulation model) is used to estimate the evaporative contributions of several oceanic regions (defined by temperature) to Antarctica's July precipitation. Tracer diagnostics in the GCM suggest that the weighted average evaporative source temperature for antarctic precipitation as a whole is about 12 C. The average source temperature for local precipitation there varies from 9 C to 14 C. To examine the effect of evaporative source on water isotope concentration, the GCM also follows a global deuterium (HDO) tracer and deuterium tracers evaporating from each oceanic region. The results suggest that although evaporative source temperature does affect the concentrations of the individual HDO tracers, differences in evaporative source do not explain the scatter in the roughly linear relationship between condensation temperature and isotope concentration. (Auth. mod.)

Huang, J., Bowman, K.P., **Small ice cap instability in seasonal energy balance models,** *Climate dynamics,* June 1992 7(4), p.205-215, 16 refs.

Results from a two-dimensional energy balance model with a realistic land-ocean distribution show that a small ice cap instability exists in the Southern Hemisphere, but not in the Northern Hemisphere. A series of experiments using a one-dimensional energy balance model with idealized geography are used to study the roles of the seasonal cycle and the land-ocean distribution. The results indicate that the seasonal cycle and land-ocean distribution can influence the strength of the albedo feedback, which is responsible for the small ice cap instability, through two factors: the temperature gradient and the amplitude of the seasonal cycle. The land-ocean distribution in the Southern Hemisphere favors the small ice cap instability, while the land-ocean distribution in the Northern Hemisphere does not. Because of the longitudinal variations of land-ocean distribution in the Northern Hemisphere, the behavior of ice lines in the Northern Hemisphere cannot be simulated and explained by a model with zonally symmetric land-ocean distribution. Model results suggest that the small ice cap instability may be a possible mechanism for the formation of the antarctic icesheet. The model results cast doubt, however, on the role of small ice cap instability in Northern Hemisphere glaciations. (Auth.)

Kawahira, K., Hirooka, T., **Variations of mean zonal winds relating to the ozone hole,** *Journal of geophysical research,* June 20, 1992 97(D9), p.10,157-10,163, 17 refs.

Dynamical effects on the development of the antarctic ozone hole have been investigated through the analysis of the interannual variations of the monthly mean zonal winds in the Southern Hemisphere (SH) stratosphere using the National Meteorological Center analyzed geopotential height data, below and above 50 mbar, and the United Kingdom Meteorological Observatory analyzed temperature data, from which geopotential heights are calculated. It is found that the year-to-year changes of the mean zonal winds in the SH winter and spring in the lower stratosphere have shown no clear trends during the period 1980-1988, in contrast to the ozone depletion and temperature decline. There are apparent differences in the zonal wind comparison between the 1980s and the early 1970s which are cited from the new CIRA model compiled by Barnett and Corney (1985). This seems to indicate that the dynamical condition appropriate for the development of the ozone hole, less poleward transport of heat and ozone by planetary waves, had been already present during the appearance of the ozone hole in about 1980, and is still continuing. (Auth. mod.)

Austin, J., Butchart, N., **Three-dimensional modeling study of the influence of planetary wave dynamics on polar ozone photochemistry,** *Journal of geophysical research,* June 20, 1992 97(D9), p.10,165-10,186, Refs. p.10,184-10,186.

The influence of planetary wave dynamics on polar ozone photochemistry is examined, using a three-dimensional model of the stratosphere and lower mesosphere. The model contains a comprehensive range of photochemical reactions and includes heterogeneous reactions and polar ozone chemistry. The model is forced at its lower boundary (316 mbar) with a specified wavenumber one geopotential height field. Idealized experiments are performed using the same zonally symmetric initial conditions but with different wave amplitudes at the lower boundary. The wave amplitudes are chosen to cover the range from a zonally symmetric integration, through typical Southern Hemisphere wave amplitudes to typical Northern Hemisphere springtime amplitudes. In each experiment the model is integrated for 100 days, covering the winter and springtime period during which the antarctic ozone hole is observed to develop and partially recover. The modeled ozone amounts over the polar region in these experiments show a considerable sensitivity to the planetary wave forcing. Results are broadly consistent with the known phenomenology of polar ozone chemistry in both Northern and Southern Hemispheres. An analysis of the mechanisms through which planetary wave amplitudes influence polar ozone chemistry in these experiments is presented. In particular, wave-induced mean descent over the whole polar region is identified as an important ingredient for determining the different behavior of polar ozone in the experiments. (Auth. mod.)

Herber, A., Wendisch, M., Leiterer, U., Notholt, J., **Measurements of the optical depth and retrieval of aerosol parameters in the polar regions,** *Journal of aerosol science,* 1991 22(Suppl.1), European Aerosol Conference, 19th, Karlsruhe, Germany, Sep. 16-20, 1991. Proceedings, p.S415-S418, 9 refs.

Measurements of the direct sunlight in the UV/VIS have been performed in the Arctic, Antarctica and Germany to obtain the aerosol optical depth. The aerosol optical depth has been inverted in two ways to get the aerosol size distribution. The results show that in the Arctic due to the continental influence the values for the aerosol optical depth and for the number and size of aerosols are much higher than in the Antarctic. In both regions aerosol fluctuations and bimodal distributions can be observed. (Auth.)

Konishi, H., **Antarctic climate research data. Part 5: PPI radar data at Syowa Station, Antarctica, from Feb. to Dec. 1989,** *Japanese Antarctic Research Expedition. JARE data reports,* Mar. 1992 No.173, 60p., 3 refs.

A 5-year program of Antarctic Climate Research has been carried out at Showa, Asuka and Mizuho stations, and the surrounding ice sheet and sea ice area from 1987 to 1991 by the Japanese Antarctic Research Expedition. The main research subjects are: interannual variation of the antarctic atmosphere; sea ice-atmosphere interaction; variation of the ice sheet and the ice shelf; and ice core analysis. In JARE-29 and -30, the 2nd and 3rd year of this program, the items mainly observed were related to the interannual variation of the antarctic atmosphere. Data of precipitation clouds, obtained using a PPI (Plan Position Indicator) radar in 1989, are shown in this report. Instrumentation used in the observational program and data processing are discussed. The data in the various tables, figures and graphs are explained.

Yamanouchi, T., comp., Seko, K., comp., **Antarctica from NOAA satellites. Clouds, ice and snow,** Tokyo, National Institute of Polar Research, 1992, 91p., In Japanese and English. 19 refs.

This book is organized into 4 chapters: Ch.1 is an introduction, explaining the Antarctic Climate Research (ACR) plan and the role of NOAA satellite observations and data in it, and giving an overview of the satellite observations; Ch.2 discusses clouds, a subject on which a great deal is expected from meteorological satellite observations; Ch.3 shows the sea ice around Antarctica, which responds to climatic variations in a relatively short time and in turn is thought to cause climatic variations; Ch.4 shows the antarctic ice sheet and the interaction between its surface condition and atmospheric phenomena, such as katabatic winds. The enclosed NOAA satellite AVHRR images of an area in East Antarctica, which are received at Showa Station, cover the 4-year period, starting in 1987, of the ACR Project.

Kirchhoff, V.W.J.H., Da Silva, I.M.O., **Ozone measurements on Antarctic Peninsula** [Medidas de ozônio na península Antárticaȷ, Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.63-80, In Portuguese with English summary. 11 refs.

Ozone measurements were taken over a 4 month period at the Comandante Ferraz Station, during two summer seasons: Feb.-Mar. of 1984-85, and Dec.-Jan. of 1987-88. Ozone was detected by UV absorption. During the observation period the concentration was quite stable at 1.5 m above ground level, in comparison to other Brazilian ecosystems, with an average of 15 ppbv (parts per billion by volume). No diurnal variation was observed. During the second experiment, CO and H2 were also measured using gas chromatography. Among the CO samples, the antarctic concentration values were the lowest, at 40 ppbv. It appears that these parameters have not yet been affected by the O3 destruction in the stratosphere. (Auth. mod.)

Kirchhoff, V.W.J.H., **Antarctic ozone hole: recent results** [O buraco de ozônio da Antártica: resultados recentes], Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.81-99, In Portuguese with English summary. 11 refs.

Recent measurements indicate that ozone destruction in the antarctic stratosphere is due to chemical reactions of ozone and chlorine. The latter is added to the atmosphere by anthropogenic means, being part of artificial molecules that are very stable in the troposphere: the CFCs. The status of very stable is changed in the stratosphere to very unstable by UV radiation, which frees the chlorine atom by photolysis. This starts the ozone destruction process. Ozonesonde data show that the ozone total content decreased from 300 DU (Dobson Units) to 175 DU between Aug. 15 and Sep. 15, 1987, near Comandante Ferraz Station. (Auth. mod.)

Pereira, E.B., **Radon as a natural atmospheric tracer on the Antarctic Peninsula** [O radônio na península Antártica como traçador natural da atmosfera], Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.100-116, In Portuguese with English summary. 12 refs.

Atmospheric radon-222 was continuously measured during 1986 at the Comandante Ferraz Station. A concentration of 2.6 +/- 0.018 Bq/cu m on the average was found, but occasional peaks of 0.126 Bq/cu m were also present. Data showed a periodicity of 25 days and a strong association with short period temperature increases. This preliminary interpretation of the data indicates a continental influence of air masses from the southern extreme of the South American continent. (Auth.)

Artaxo, P., Andrade, F., Setzer, A.W., **Elementary composition and sources of aerosols in the atmosphere** [A composição elementar e as fontes de aerossóis na atmosfera], Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.117-129, In Portuguese with English summary. 3 refs.

This work reports a composition study of aerosols sampled since 1985 at the Comandante Ferraz Station. A nuclear method for total analysis like PIXE, as well as the X-ray electron micropulse method for individual particle analysis, have been employed. Very low aerosol concentrations are found; 85% of the aerosol is of marine composition, but soil and sulphur compounds are also present in the fine particulate. (Auth.)

Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.130-137, In Portuguese with English summary. 2 refs.

Due to atmospheric nuclear tests from 1940 to 1980, different radioactive elements of long half-life (Sr-90, Cs-137) were introduced into the atmosphere. Year by year, these radionuclides precipitate on the earth's surface as radioactive fallout. The biosphere in particular is a good radioactive fallout accumulator and it is the basic medium used in this work. During 1986, samples of moss were collected and analyzed on King George I., as well as additional samples of ice, snow, sea water and sediments. The results confirm small levels of radioactivity in all of the studied materials with the exception of mosses, which showed higher concentrations. Experimental results obtained with these samples are presented and a proposal for future work on this project is discussed. (Auth.)

Moreira-Nordemann, L.M., Forti, M.C., Setzer, A.W., **Chemical composition of rain water at Comandante Ferraz Station** [Composição química das águas de chuva na estação Comandante Ferraz—Antarctica], Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.193-213, In Portuguese with English summary. 24 refs.

Chemical analyses of rain water samples collected at Comandante Ferraz Station during 1985, 1986 and 1987 summers were carried out and pH values were measured. The results show a large range variation of ion contents, and strong marine influence in the chemical composition of the rain. Meteorological conditions during precipitation events also influence that composition. NO concentrations exhibit an anomalous behavior, and do not correlate with SO variations. It is noted that rain water on Antarctic Peninsula is slightly acid.

Stevenson, M.R., De Carvalho, P.R., **Meteorological measurements made using Brazilian drifting buoys: technical aspects and first results,** Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.215-230, 7 refs.

Progress in the technical development and use of meteorological sensors fixed to a Brazilian drifting oceanographic buoy is reported. Research with thermistors to measure both air and water temperatures from buoys showed promise with regard to simplicity in their applications and the associated costs. These sensors were designed, tested and used in Antarctica in Mar. 1985 and after being redesigned, used again during Jan.-Apr. of 1987. A significant advancement was made during 1987 with the construction of a compact tower to support meteorological sensors 2 m above the water line of the buoy. This instrumented buoy was used in the Polar Front of the Antarctic Circumpolar Current, in the Drake Passage during Dec. 1987. The buoy's sensors included two each for air and water temperature, an anemometer for wind speed and direction, and an electronic compass within the buoy to compensate for the effects of buoy rotation on wind direction. Problems related to the development and use of these drifting buoys and their data are discussed and future expectations are noted. (Auth.)

Cariolle, D., Amodei, M., Simon, P., **Dynamics and the ozone distribution in the winter stratosphere: modelling the inter-hemispheric differences,** *Journal of atmospheric and terrestrial physics,* May 1992 54(5), p.627-640, 20 refs.

Model results of ozone distribution in both hemispheres are discussed. The model extends from ground to mesospheric levels with a spectral horizontal resolution up to isotropic wavenumber 42. It incorporates a fully interactive scheme for the ozone mixing ratio which accounts for photochemical sources and sinks, advection by the model winds and coupling with radiative calculations. The model reproduces the large scale inter-hemispheric differences quite well, with a very stable and cold vortex in the Southern Hemisphere and a warmer vortex, often distorted, in the Northern Hemisphere. It is concluded that due to interactions among dynamics, polar stratospheric cloud formation and chemistry, there is a possibility that some stratospheric ozone depletion could occur in late winter near the night terminator in the Northern Hemisphere, whereas significant ozone depletion only occurs in early spring in the Southern Hemisphere. The importance of synoptic scale dynamics on the ozone transport between the high latitudes and the equator is also stressed. The model develops tongues of ozone-rich air from the high latitudes which are irreversibly mixed at mid-latitudes with tongues of ozone-poor air from the low latitudes. Similar tongues or filaments are clearly visible in the TOMS satellite data. (Auth. mod.)

Johnson, B.J., Deshler, T., Thompson, R.A., **Vertical profiles of ozone at McMurdo Station, Antarctica; Spring 1991,** *Geophysical research letters,* June 2, 1992 19(11), p.1105-1108, 5 refs.

Forty-three vertical profiles of ozone and temperature were measured at McMurdo Station from Aug. 23-Nov. 1, 1991. The data showed severe ozone depletion during the springtime, for the third consecutive year. The lowest total column ozone, 146 DU on Oct. 10, was equal to the minimum measured in 1990, while the 18 km ozone mixing ratio on this day was 0.1 ppmv, a factor of 2 below the previous minimum observed at this altitude. Most of the ozone depletion was once again confined to the 12-20 km layer, where an 83% reduction (105 DU to 18 DU) was observed, although there were also signs of depletion occurring in the 24-30 km region and below 12 km. Intrusions of ozone-rich air above 20 km caused substantial increases in total ozone during two periods when McMurdo was near or within the polar vortex wall. (Auth.)

Saxena, V.K., **Climate forcing due to non-sea-salt sulfates,** *IAHS publication,* 1991 No.208, Glaciers-ocean-atmosphere interactions. Edited by V.M. Kotliakov, A. Ushakov, and A. Glazovskiĭ, p.243-255, 33 refs.

The current state of the concept on ocean-derived cloud condensation nuclei (CCN) is reviewed. Salient maritime CCN sample measurements have been made in recent years and examples of CCN activation spectrum over the World Ocean are presented with an analysis of current evidence regarding the role of CCN in regulating the temperature of the earth-troposphere system. The possible impact of increased oceanic emission of dimethylsulfate (DMS) on greenhouse warming is analyzed. Further investigations of biogenic CCN are directly needed in order to advance the understanding of biosphere-geosphere interactions. Recent data from Vostok ice cores are in agreement with the idea of influence of DMS emissions on climate changes. (Auth.)

Lubin, D., **Contribution toward understanding the biospherical significance of antarctic ozone depletion,** *Journal of geophysical research,* May 30, 1992 97(D8), p.7817-7828, 42 refs.

Measurements of biologically active UV radiation made by the National Science Foundation (NSF) scanning spectroradiometer (UV-monitor) at Palmer Station during the austral springs of 1988, 1989, and 1990 are presented and compared. Column ozone abundance above Palmer Station is computed from these measurements using a multiple wavelength algorithm. Two contrasting action spectra (biological weighting functions) are used to estimate the biologically relevant dose from the spectral measurements: a standard weighting function for damage to DNA, and a new action spectrum representing the potential for photosynthesis inhibition in antarctic phytoplankton. The severe ozone holes of 1989 and 1990, in which the ozone abundance regularly fell below 200 DU (Dobson units), brought about increases in UV surface irradiance weighted by either action spectrum. Ozone abundances and dose-weighted irradiances provided by the NSF UV-monitor are used to derive the radiation amplification factors (RAFs) for both DNA-effective irradiance and phytoplankton-effective irradiance. The RAF for DNA-effective irradiance is nonlinear in ozone abundance and is in excess of the popular "two for one" rule, while the RAF for phytoplankton-effective irradiance approximately follows a "one for one" rule. Rosenfield, J.E., **Radiative effects of polar stratospheric clouds during the Airborne Antarctic Ozone Experiment and the Airborne Arctic Stratospheric Expedition,** *Journal of geophysical research,* May 30, 1992 97(D8), p.7841-7858, 53 refs.

Daily, three dimensional fields of both Type I nitric acid trihydrate (NAT) and Type II water ice polar stratospheric clouds (PSCs) have been generated in the polar regions during the period of the Airborne Antarctic Ozone Experiment (AAOE) and the Airborne Arctic Stratospheric Expedition (AASE) aircraft missions. Mission data on particulate composition and size, together with National Meteorological Center (NMC) analyzed temperatures, have been used. Mie theory and a radiative transfer model were used to compute the radiative heating rates during the mission periods, for clear and cloudy lower sky cases. Only the Type II water ice clouds have a significant radiative effect, with the Type I NAT PSCs generating a net heating or cooling of 0.1 K/d or less. The major effect of PSCs during AAOE appears to be one of net heating, with maximum heating rates as large as 0.5 K/d for particular days. Heating rates of 0.3 K/d or greater were computed during the periods of Sep. 1-6 and Sep. 11-14. This additional heating was generally found over the western part of Antarctica and near the coastal regions, while a small cooling was computed over the Antarctic Plateau. On the whole, the radiative effects of PSCs appear to be too small to have an appreciable impact on vertical motions except over time scales of a few days during AAOE. This result makes it unlikely that the radiative-dynamical mechanisms proposed for the antarctic ozone depletion play any significant role. (Auth. mod.)

Schoeberl, M.R., Lait, L.R., Newman, P.A., Rosenfield, J.E., **Structure of the polar vortex,** *Journal of geophysical research,* May 30, 1992 97(D8), p.7859-7882, 69 refs.

Reconstruction of the Airborne Antarctic Ozone Experiment and Airborne Arctic Stratosphere Expedition aircraft constituent observations, radiative heating rate computations, and trajectory calculations are used to generate comparative pictures of the 1987 Southern Hemisphere (SH) late winter and 1989 Northern Hemisphere (NH) midwinter lower stratospheric polar vortices. Overall, both polar vortices define a region of highly isolated air, where the exchange of trace gases occurs principally at the vortex edge through erosional wave activity. Aircraft measurement showed that (1) between 50 and 100 mbar, horizontally stratified long-lived tracers such as N2O are displaced downward 2-3 km on the cyclonic (poleward) side of the jet, with the meridional tracer gradient sharpest at the jet core. (2) Eddy mixing rates, computed using parcel ensemble statistics, are an order of magnitude or more lower on the cyclonic side of the jet compared to those on the anticyclonic side. (3) Poleward zonal mean meridional flow on the anticyclonic side of the jet terminates in a descent zone at the jet core. Despite the similarities between the SH and NH winter vortices, there are important differences. During the aircraft campaign periods, the SH vortex jet core was located roughly 8-10 deg equatorward of its NH counterpart after pole centering. As a result of the larger size of the SH vortex, the dynamical heating associated with the jet core descent zone is displaced further from the pole. The SH polar vortex can therefore approach radiative equilibrium temperatures over a comparatively larger area than the NH vortex. The subsequent widespread formation of polar stratospheric clouds within the much colder SH vortex core gives rise to the interhemispheric differences in the reconstructed H2O, NOy, ClO, and O3 species which are affected by polar stratospheric clouds. (Auth. mod.)

Kawa, S.R., **Photochemical partitioning of the reactive nitrogen and chlorine reservoirs in the high-latitude stratosphere,** *Journal of geophysical research,* May 30, 1992 97(D8), p.7905-7923, Refs. p.7921-7923.

Partitioning of the major components of the reactive nitrogen and inorganic chlorine reservoirs is derived from aircraft measurements in the lower stratosphere during the winter season in both hemispheres at latitudes of about 60-80 deg. The goal of this work is to exercise the power of the correlated set of measurements from polar missions of the NASA ER-2 aerial surveys to amplify the individual measurements. The results provide a consistent method for comparing distributions, and hence the controlling processes, between different areas of the near-polar regions. The analysis provides clear evidence of the effects of heterogeneous processes in the atmosphere. The resulting latitude distributions in the Arctic outside the vortex agree reasonably well with predictions of a two-dimensional photochemical model, indicating that partitioning in this region is largely controlled by standard homogeneous gas phase chemistry. The partitioning in the Antarctic suggests that nearly the entire range of latitudes sampled by the ER-2 is affected by heterogeneous processes *in situ,* including that portion of the "collar" region equatorward of the nominal chemically perturbed region (CPR). Consideration of heterogeneous processing in the region outside the CPR is important in predicting the possible expansion of antarctic ozone depletion and the transport of chemically perturbed air to lower latitudes. (Auth. mod.)

Solomon, S., Keys, J.G., **Seasonal variations in antarctic NOx chemistry,** *Journal of geophysical research,* May 30, 1992 97(D8), p.7971-7978, 43 refs.

Measurements of NO2 from two sites in the Antarctic are compared with model calculations that include a detailed treatment of diurnal NOx chemistry for fall, winter, and spring. Observed slant column amounts in spring provide strong evidence for important heterogeneous effects, probably through polar stratospheric cloud chemistry. It is shown that the slow growth of NO2 column observed during September is consistent with release of NO2 from N2O5 formed above the altitudes where polar stratospheric clouds occur. The observed early fall column amounts are in good agreement with model calculations, and the sharp onset of diurnal variation in column NO2 obtained near day 57 is well simulated. Following this period, gas-phase model calculations suggest that N2O5 will rapidly accumulate during the antarctic fall as nights become longer. It is suggested that the high-latitude fall period during which N2O5 grows rapidly represents an optimum time to search for evidence of possible heterogeneous chemistry on background aerosols. (Auth. mod.)

Pitari, G., Visconti, G., Verdecchia, M., **Global ozone depletion and the antarctic ozone hole,** *Journal of geophysical research,* May 30, 1992 97(D8), p.8075-8082, 27 refs.

The secular trend of the antarctic ozone hole has been studied with a two-dimensional model which can simulate formation of polar stratospheric clouds and includes heterogeneous chemical reactions. Results from the numerical simulation have been validated by comparison with available experimental data. Trends up to the year 2010 using standard (i.e., homogeneous) and heterogeneous chemistry have been compared, and show that global ozone depletion reached 5-6% in the last 30 years and will average 8% for the next 20 years. Subtracting a 2% loss due to standard chemistry in the presence of trace gas increase in the last 30 years, the authors find a 3-4% global ozone loss due to heterogeneous chemistry. The depletion is evident even outside the Southern Hemisphere spring season and at mid-latitudes, pointing to an increase in global ozone sink. (Auth. mod.)

Madronich, S., Granier, C., **Impact of recent total ozone changes on tropospheric ozone photodissociation, hydroxyl radicals, and methane trends,** *Geophysical research letters,* Mar. 3, 1992 19(5), p.465-467, 23 refs.

Trends in total atmospheric ozone from 1979-1989 were analyzed to derive the corresponding changes in the tropospheric photodissociation rate coefficient *J*1 for the reaction O3+hv *(lambda*<330 nm) reaction O2+O(1D). Zonally and annually integrated trends in *J*1 are +3.8% per decade in the Northern Hemisphere and 4.1% per decade in the Southern Hemisphere. Changes in [OH] due to the *J*1 trends may have contributed to the slowing of atmospheric methane increases observed in recent years. (Auth.)

Yang, X.Q., Huang, S.S., **Numerical experiment of climatic effect of antarctic sea ice during the Northern Hemisphere summer,** *Chinese journal of atmospheric sciences,* 1992 16(1), p.80-89, 15 refs.

In this paper, the short-term climatic effect induced by the removal of antarctic sea ice is studied by using a perpetual July general circulation model. The results show that the removal of antarctic sea ice appears to weaken the polar vortex through heating the atmosphere near the local region, and then to induce the ultra-long wave anomaly associated with amplifying the amplitude of the zonal wavenumber 3 at the middle and high latitudes of the Southern Hemisphere. Anomalies of the southern hemispheric circulation intensify the East Asian monsoon and rainfall, which excite a wavetrain from East Asia to North America and cause the anomalies of the northern hemispheric circulation. An interpretation of the dynamic mechanism of antarctic sea ice climatic effect is also proposed. (Auth. mod.)

Kane, R.P., **Extension of antarctic ozone hole to lower latitudes in the South-American region,** *PAGEOPH,* 1991 135(4), p.611-624, Refs. p.622-624.

A comparison of monthly mean values of total ozone at South Pole, Buenos Aires (Argentina), Cachoeira Paulista and Natal (Brazil), and Huancayo (Peru) revealed that whereas South Pole showed an ozone depletion of 45% in Oct. 1987 (as compared to Oct. 1977), Buenos Aires showed a small decrease (10%) while the other locations showed very small decreases (1-2%). When daily values are considered, the antarctic ozone hole of Oct. 1987 seems to have caused 10% depletion at Buenos Aires and 5% at Natal and Huancayo in Dec. 1987. However, a large part of this is normal seasonal variation, except at Huancayo, where a residual effect of 5% depletion in Dec. 1987 remains. The QBO effects (5-8% changes in the ozone level in 2-3 years) could cause 10-15% fluctuations in solar UVB on the ground on clear-sky days, and could be a possible health hazard unless factors like cloudiness reduce the UVB intensities. (Auth.)

Rycroft, M.J., **Atmospheric and space research from the polar regions,** *Physics education,* 1991 Vol.26, p.153-158.

The polar regions are unique laboratories for carrying out research on both the atmosphere and the near-Earth space environment. The relatively undisturbed conditions help us explore phenomena like the greenhouse effect and the springtime antarctic ozone depletion, the so-called ozone hole. Further out, UV and x-radiation from the Sun produce the Earth's ionosphere, vital for man's communication network. Yet satellite and polar research is showing us how events on the Sun can adversely affect this near-Earth space environment.

Li, J.J., **Comparison of Lanzhou loess profile with Vostok ice core in Antarctica over the last glaciation cycle,** *Science in China. Series B,* Apr. 1992 35(4), p.476-487, 17 refs.

Loess near Lanzhou from the late Pleistocene was very sensitive to climatic fluctuations. The Beiyuan terrace profile in Linxia City, whose curve of susceptibility tallies with the trend of isotopic curves of the Vostok ice core in Antarctica, is 35 m thick. There are five layers of paleosols under Malan loess. The upper three layers correspond to three warm stages in the last interglaciation. Interstadial of Last Glacial (C stage in the antarctic ice core) was clearly recorded in the Beiyuan profile, in which three layers of paleosols and two of loess were formed. The lowest section of the profile belongs to the penultimate glaciation, in which fossils of cold-drought-resistant mammals and molluscs have been discovered. In this paper, these soil profiles are correlated with dates of antarctic ice cores in an effort to define present understanding of continental variations in paleoclimate and glaciation. (Auth. mod.)

Oeschger, H., **Atmospheric CO2: global change and regulation mechanisms,** *Berichte der Bunsen-Gesellschaft für Physikalische Chemie,* Mar. 1992 96(3), p.252-257, 23 refs. Presented at Discussion Meeting of the journal: Physics and Chemistry of the Atmosphere, Schliersee, Bavaria, Oct. 7-9, 1991.

Models for the CO2 uptake by the carbon system have been developed which are capable of reproducing the result of the drop in the rate of increase of CO2 emissions from 4.5% to 2% per year following the oil embargo in 1973. Of special interest regarding the understanding of the carbon cycle and its role in controlling the climate of the Earth are the observations in polar ice cores covering the past 160,000 years, corresponding to one and a half glaciation cycles. They show variations of atmospheric CO2, CH4 and N2O parallel to the climatic variations. Measurements of C- 13/C-12 in shells of foraminiferas support the hypothesis that these CO2 changes are caused by changes in the ocean's biological pump, i.e. the flux of detrital organic carbon from the surface to the deep ocean, which affects the total inorganic carbon in the surface ocean and the partial pressure of CO2. Stolarski, R.S., **Observation of global stratospheric ozone change,** *Berichte der Bunsen-Gesellschaft für Physikalische Chemie,* Mar. 1992 96(3), p.257-263, 35 refs. Presented at Discussion Meeting of the journal: Physics and Chemistry of the Atmosphere, Schliersee, Bavaria, Oct. 7-9, 1991.

Measurements of the total column amount of ozone from the Total Ozone Mapping Spectrometer (TOMS) on the Nimbus 7 satellite have now been made for 13 years. They show that the 1991 antarctic ozone hole again had a pronounced minimum in early October, indicating deep ozone holes in four of the last five years. Global scale measurements by TOMS show no trend in total ozone near the equator, but a significant trend at northern middle and high latitudes. This trend has a pronounced seasonal variation with maximum in winter. The observed trend is significantly larger than the predictions of gas-phase photochemical models. (Auth. mod.)

Leiterer, U., Weller, M., Herber, A., **Global changes of aerosols—ground based monitoring of the optical thickness in polar regions and central Europe,** *Berichte der Bunsen-Gesellschaft für Physikalische Chemie,* Mar. 1992 96(3), p.377-380, 9 refs. Presented at Discussion Meeting of the journal: Physics and Chemistry of the Atmosphere, Schliersee, Bavaria, Oct. 7-9, 1991.

Optical thickness measurements in north polar, south polar and central European regions are presented and discussed in comparison with earlier values. Actinometer measurements of the integral optical thickness in the Arctic (Franz Joseph Land) from 1933 to 1942 show an average level of about 0.22 and only minor changes between spring and summer and from year to year. Since 1955 the spring values show a pronounced increase to 0.3 in 1985. In contrast to this behavior, the levels in Antarctica (Mirnyy) are much lower (around 0.18) and fairly stable between 1957 and 1990 except for two time periods with strong volcanic activities with peaks up to 0.28. Spectral aerosol thickness data at 500 and 1000 nm for Antarctica from 1955 to 1990 indicate marked volcanic activity with data rising from a level around 0.03 to two maxima of about 0.12. In Mar. 1989, the boundary layer extinction coefficient at 500 nm in the Arctic reached 79-fold of the Antarctic and 2.5- fold of the central Europe values at Lindenberg. The very high winter and spring aerosol extinction coefficients in the Arctic result from long-range transport and gas-to-particle conversion of NOx and SO2. (Auth. mod.)

Colacino, M., ed, Giovanelli, G., ed, Stefanutti, L., ed, Italian Research on Antarctic Atmosphere, 1st Workshop, Porano, Nov. 11, 1988, **Conference proceedings of the Italian Research on Antarctic Atmosphere, Vol.20,** Bologna, Italian Physical Society, 1989, 232p., Refs. passim. For individual papers see I-46778 through I-46796 and K-46797.

This is a collection of papers presented at the 1st Workshop of Italian Research on Antarctic Atmosphere, held Nov. 11, 1988, in Porano, Italy. It consists of more than 20 papers divided into five fields: meteorology and climatology, aerosol and tropospheric clouds, planetary boundary layer, chemical/physical stratospheric properties, and aeronomy. Introductory speeches deal, among others, with objectives of the Italian research program in Antarctica, the current and future prospects of antarctic projects, and Italian participation in SCAR meetings.

Stefanutti, L., **Review of the ozone hole issue as discussed at the Quadrennial Ozone Symposium in Goettingen—August 1988,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.13-21, 37 refs.

Forty-four papers and a general review were presented in the ozone hole session during the Quadrennial Ozone Symposium, which took place in Goettingen in Aug. 1988. The general review was presented by G. Grasseur of the Institut d' Aeronomie Spatiale of Belgium. The papers dealt both with experimental measurements carried out in Antarctica and in the Arctic, and with climatic and chemical models. (Auth.)

Colacino, M., **Italian researches on atmospheric physics in Antarctica: a review,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol. 20, Bologna, Italian Physical Society, 1989, p.23-36, 17 refs.

In Nov. 1988 a workshop was held in Porano, Italy on research carried out in Antarctica by Italian scientists. The purpose of the meeting was twofold: to present the results of different activities after three years of work; and to delineate the trends of development for future studies. In the present note, after a short review of the general plan of atmospheric research, the development of various projects is examined. Some remarks concerning the future are included. (Auth.)

Anav, A., **Some air temperature patterns recorded at Terra Nova Bay during winter 1987,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.59-63.

Data obtained at meteorological stations installed at Terra Nova Bay since 1985 are discussed. The data processing systems, equipment and methods used are described, and air and ground temperature patterns recorded during winter 1987 are shown and analyzed. Planned activities for the 1988-1989 season, including the installation of 4 outer automated stations with radio transmission and one central receiving unit replacing old meteorological screens, are outlined.

Tomasi, C., Vitale, V., Tagliazucca, M., **Atmospheric turbidity measurements at Terra Nova Bay during Jan. and Feb. 1988,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.67-77, 20 refs.

The spectral measurements of direct solar irradiance, taken with a multiwavelength sun photometer at Terra Nova Bay during Jan. and Feb. 1988, are examined by the Langley plot method to check the reliability of the calibration values determined from high-mountain measurements performed in Italy. This analysis clearly shows that the output signals are affected by diffuse solar radiation entering the instrument, in spite of the narrow field of view used. Applying the Langley plot method within a limited range of air mass resulted in a new set of calibration values. The mean daily values of the atmospheric turbidity parameters alpha and beta were found to range between 0.78 and 1.53 and between 0.021 and 0.039, respectively, while the aerosol particle optical thicknesses at visible and near-infrared wavelengths showed a general tendency to gradually increase from one day to another during Jan., reaching maximum values at the beginning of Feb. (Auth. mod.)

Ciattaglia, L., Moleti, A., **Aerosol optical depth in the antarctic atmosphere: Rayleigh scattering and ozone influence on sun photometry at Terra Nova Bay,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.79-87, 1 ref.

Dual wavelength sun photometers were used at Terra Nova Bay to measure aerosol optical depth. Problems in interpretation of the data arose because of instability in the filters, and the calibration coefficients derived at a temperate zone location (Mount Cimone, 2165 ms., Italy) were not applicable in the polar region. Even allowing for filter changes it was necessary to reduce the aerosol and ozone optical depths by approximately 10%. It is concluded that values usually adopted for these coefficients at mid latitudes should be considerably reduced in the use of sun photometry in Antarctica. (Auth.)

Santachiara, G., Prodi, F., Tagliazucca, M., **Characterization of aerosol at Terra Nova Bay, Antarctica,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.89-101, 22 refs.

Antarctic aerosol was sampled at Terra Nova Bay using an inertial spectrometer at high flow rate. This instrument can sample aerosol and deposit particles on a membrane filter with size separation. The density of single particles and average density vs. aerodynamic diameter have been evaluated. Chemical composition of aerosol particles was determined by analyzing samples taken on Millipore filters by scanning electron microscope and X-ray energy spectrometer. Results show that for particles with radius $>$ 0.5 micron, frequency of sea-salts increases when aerodynamic diameter decreases. An opposite behavior is displayed by crustal elements. A chlorine loss in sea-salt particles has been observed. A mechanism for this loss is suggested. (Auth.)

Morandi, M., **Antarctic tropospheric clouds characterization using an elastic backscattering lidar,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.111-120, 14 refs.

The Lidar Group of IROE is used by the Italian national program of research in Antarctica (PNRA) in two projects: the ozone hole phenomenon and antarctic climatology. In this paper, the research activities on antarctic tropospheric clouds carried out during the 1987-1988 season at the Terra Nova Bay Station are described. Future activities, dealing mainly with the ECLIPS (Experimental Clouds Lidar Pilot Study) international project, are outlined. Some experimental data are presented and the processing methods are described. (Auth. mod.)

Bonasoni, P., Giovanelli, G., Georgiadis, T., Tagliazucca, M., **Meteorological variables and ozone concentration measured in the surface layer at the Italian station of Terra Nova Bay, Antarctica,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.123-136, 19 refs.

Microclimatological, meteorological and environmental measurements were performed during Jan. and Feb. 1987-1988 at Terra Nova Bay Station to determine certain characteristics of the atmospheric surface layer, such as profiles of wind, temperature and ozone concentration versus stability. Only qualitative results are presented. The temperature measurements at various levels up to 6 m indicate that the profile is quasi permanently superadiabatic. This behavior is due to the high incoming radiation and transparency of the atmosphere. Ozone concentration measurements at 3 levels up to 10 m, averaged over 10 minutes, display profiles characterized by strong gradients. The maximum concentrations (about 30 ppb for periods of 3-4 hours) were observed in the early afternoon in connection with southeasterly winds. (Auth. mod.)

Bonino, G., Longhetto, A., Trivero, P., **Radio-acoustic measurement of the vertical thermal profile in the antarctic lower troposphere,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.145-152, 11 refs.

The vertical thermal profile of the antarctic planetary boundary layer (PBL) can be continuously monitored by the Radio Acoustic Sounding System (RASS). The apparatus utilizes an acoustic wavelength lambda a = 1 m. Since 1978 it has been in use for study of the PBL in the Po Valley, Italy. It will be adapted to measure the strong thermal gradients developing in the lower troposphere of Antarctica by improving the capability of the present system to sound different atmospheric layers with different acoustic frequencies. Gobbi, G.P., **Role of stratospheric clouds in the polar ozone depletion: modelling denitrification and dehydration,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.171-173, 13 refs.

From a brief analysis of pertinent literature, the following conclusions are made: polar stratospheric clouds (PSCs) are regarded as major contributors to the process of ozone depletion over Antarctica. In particular, PSCs appear to have a twofold effect: they denitrify and dehydrate the stratosphere and provide the surfaces onto which ozone related reactions can take place.

Adriani, A., Gobbi, G.P., Viterbini, M., Ugazio, S., **Balloon-borne CCD sonde for observations of stratospheric ice crystals,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.175-178, 9 refs.

A proposal for in-situ inspection of polar stratospheric clouds (PSCs) was approved by the Italian Antarctic Program in 1988. A balloon-borne sonde for observations of PSC ice crystals larger than 4 microns is under development. The instrument will use microscopic techniques and CCD detection to provide images of the larger and most irregular constituents of PSCs. The sonde will ascend up to heights of approximately 20 km, thus exploring the region of maximum ozone depletion of the polar springtime stratosphere. (Auth.)

Pitari, G., Verdecchia, M., Visconti, G., **Ozone hole simulation using a prescribed dynamical field,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.179-196, Refs. p.194-196.

Different theories have been proposed recently to explain the origin and evolution in time of the ozone hole in the antarctic polar region. It is suggested that many of these theories require pure chemical perturbations, while others deal with dynamical and thermodynamical processes. It is proposed that what seems most likely is a combination of the two aspects. The numerical experiment described follows this guideline. A three dimensional transport model for the ozone was built, using the velocity and temperature fields obtained from the GFDL SKYHI-N90 model. This model covers the entire globe horizontally (with a resolution of 5 deg latitude and 18 deg longitude) and uses a total of 40 pressure levels (as in the GFDL model). Results show that chemistry and dynamics are strictly connected in the ozone hole formation and persistence.

Giovanelli, G., Bonasoni, P., Evangelisti, F., Georgiadis, T., **Measurements of stratospheric gas absorption in UV and visible spectral regions,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.197-213, 16 refs.

A photodiode array spectrometer is presented which is especially appropriate for measuring column amounts of trace gases present in the atmosphere. Its optical characteristics make it possible to investigate the spectral region from 290 to 800 nm with a resolution on the order of 0.4 nm. It is designed for use in Antarctica to measure the column amounts of O3, NO2 and OClO. This type of remote sensing system is generally used to measure scattered solar light, as well as indirect sun- or moonlight observations. The method of processing zenith sky measurements is also presented, along with the first spectra obtained of zenith sky radiation. (Auth.)

Valenti, C., **Measurements of the ozone column amount at Terra Nova Bay. Preliminary results,** Italian Research on Antarctic Atmosphere, Conference proceedings, Vol.20, Bologna, Italian Physical Society, 1989, p.215-220, 4 refs.

During the 3rd Italian Antarctic Expedition (Dec. 1987-Feb. 1988), ozone measurements were made at Terra Nova Bay using for the first time the Brewer spectrophotometer. The instrument and type of measurements are described. The data are examined and compared to those collected with a Dobson spectrometer during the same period at Amundsen-Scott and Showa stations. It is concluded that, due to insufficiency of data, it is not possible to confirm or deny existing theories regarding the time and form of the ozone hole formation. (Auth. mod.)

Greenfield, L.G., **Precipitation nitrogen at maritime Signy Island and continental Cape Bird, Antarctica,** *Polar biology,* Mar. 1992 11(8), p.649-653, 22 refs.

The mineral nitrogen (NH4-N+NO3-N) in precipitation occurring at continental and maritime antarctic sites has been determined. Precipitation at sites remote from animal activity contained much less mineral-N than that occurring at sites influenced by such activity. Estimates for nitrogen input at two contrasting fellfield sites, one at continental Cape Bird (dry site), the other at maritime Signy I. (wet site) are presented. At both sites precipitation N represented the major N input to fellfield biota, compared to wind blown particulate matter containing organic nitrogen or ammonia volatilized from adjacent guano soils and becoming absorbed by moist artificial soils traps. (Auth.)

Lin, N.H., **Cloud acidity and acidic deposition in the lower troposphere and ozone depletion in the antarctic stratosphere: modeling and data analysis regarding the role of atmospheric aerosol,** Raleigh, North Carolina State University, 1991, 190p., University Microfilms order No. 92-06141, Ph.D. thesis. Refs. p.168-183.

This study is focused on the role of atmospheric aerosols in determining the cloud acidity and acidic deposition in the lower troposphere and the ozone depletion in the antarctic stratosphere. For the former, a cloud chemistry model is developed to study the in-cloud chemistry and acidity in cloud droplets. The features of the antarctic stratospheric aerosols during the ozone depletion episode of Oct. 1987 are investigated based on the SAGE II (Stratospheric Aerosol and Gas Experiment II) data. The study focuses on inferring the aerosol size spectrum using a modified randomized minimization-search-technique (RMST), and investigating the vertical, zonal and columnar averages of aerosol properties, together with the ozone concentration. The aerosol size distribution is found to be bimodal in several instances. An enhanced aerosol layer of relatively larger particles at altitudes between 21-23 km was found in the antarctic region. The relatively abundant population of smaller particles is associated with the region of severe ozone depletion. Smaller and larger particles dominate at higher and lower latitudes, respectively. It is pointed out that the reported features of the stratospheric aerosols in the antarctic region are useful in providing insights into the mechanisms for ozone depletion. (Auth. mod.)

Krueger, A., Schoeberl, M.R., Newman, P., Stolarski, R.S., **1991 antarctic ozone hole; TOMS observations,** *Geophysical research letters,* June 19, 1992 19(12), p.1215-1218, 27 refs.

The 1991 antarctic springtime ozone decline as measured by the Total Ozone Mapping Spectrometer was similar to those of earlier deep ozone hole years, 1987, 1989, and 1990. The minimum total ozone value was recorded on Oct. 5, 1991 at 108 Dobson units near the South Pole. This was 8 DU lower than in any of the earlier years. Four of the last five years have exhibited an extensive, deep ozone hole. The area of the hole was about the same as in 1987, 1989, and 1990. The recovery from the low total ozone values occurred in mid-Nov. as the polar vortex broke up. (Auth.)

Hernandez, G., Smith, R.W., Fraser, G.J., Jones, W.L., **Large-scale waves in the upper-mesosphere at antarctic high-latitudes,** *Geophysical research letters,* July 6, 1992 19(13), p.1347-1350, 24 refs.

Upper-mesosphere combined optical measurements of wind and temperature fields at Amundsen-Scott Station and wind radar measurements at Scott Base show the presence of large-scale waves in this region of the atmosphere. At Amundsen-Scott the largest amplitude wave observed with sub-diurnal periodicity appears with a frequency near 2.4/day (about 10.1 hour period), with a westward phase progression of wavenumber one. The presence of a wave with this periodicity is confirmed by the observations at Scott Base. The combination of the experimentally-found period and phase progression, associated small-temperature oscillations, and theoretical considerations lead to the interpretation of this wave as a Lamb wave. The present combination of spatially-resolved optical measurements and radar measurements illustrates the value of multiple-technique observations in elucidating the upper-mesosphere dynamical state, as well as the properties of the waves propagating through the medium where the observations are being made. (Auth.)

Kroes, G.J., Clary, D.C., **Adsorption of HCl on ice under stratospheric conditions: a computational study,** *Geophysical research letters,* July 6, 1992 19(13), p.1355-1358, 14 refs.

In modelling surface adsorption of HCl on type II PSC's, the authors performed computer simulations of adsorption of HCl on single crystal ice. For stratospheric conditions, the maximum surface coverage of ice by HCl is calculated to be 0.0000001 monolayer. This value was obtained by taking surface disorder into account. It is much too low for the reaction of HCl with chloronitrate to proceed rapidly on ordinary ice in one step. The calculated value of the surface coverage is much lower than recent experimental values for the uptake of HCl by polycrystalline ice, so the validity of the interpretation of the uptake of HCl by polycrystalline ice as being due to surface adsorption is questioned. Antarctica is identified as the locale at which this computational study could be advantageously applied. (Auth. mod.)

Torres, O., Ahmad, Z., Herman, J.R., **Optical effects of polar stratospheric clouds on the retrieval of TOMS total ozone,** *Journal of geophysical research,* Aug. 20, 1992 97(D12), p.13,015-13,024, 34 refs.

Small areas of sharply reduced ozone density appear frequently in the maps produced from polar region total ozone mapping spectrometer (TOMS) data. These mini-holes are of the order of 1000 km in extent, with a lifetime of a few days. On the basis of measurements from ground-based instruments, balloon-borne ozonesondes, and simultaneous measurements of aerosol and ozone concentrations during aircraft flights in the arctic and antarctic regions, the appearance of polar stratospheric clouds (PSCs) are frequently associated with false reductions in ozone derived from the TOMS albedo data. By combining radiative transfer calculations with the observed PSC and ozone data, it is shown that PSCs located near or above the ozone density maximum (with optical thickness greater than 0.1) can explain most of the differences between TOMS ozone data and ground or *in-situ* ozone measurements. Several examples of the real and false TOMS mini-hole phenomenon are investigated using data from the 1989 Airborne Arctic Stratospheric Expedition (AASE) and from balloon flights over Norway and Sweden. (Auth. mod.)

Deutsche Meteorologen-Tagung, Berlin, Mar. 16-20, 1992, **German Meteorologists Meeting 1992,** *Deutscher Wetterdienst, Offenbach am Main. Annalen der Meteorologie,* 1992 No.27, 425p., In German. Refs. passim. For selected papers see 47-210 through 47-218 or I-46925 through I-46928.

This is one of a series of German meteorologists meetings. The main topics of this meeting are synoptics and fronts, interaction of the atmosphere and biosphere, current problems of theoretical meteorology, the middle atmosphere, ocean circulation, climate diagnostics and modeling, and mesoscale processes. Of pertinence to the Antarctic are papers on ozone and planetary waves; geostrophic wind and sea ice motion; and heat exchange between sea ice, the ocean, and the atmosphere.

Wirth, V., **Model for quasi-stationary planetary waves in the total ozone** [Ein Modell für quasi-stationäre planetare Wellen im Gesamtozon], *Deutscher Wetterdienst, Offenbach am Main. Annalen der Meteorologie,* 1992 No.27, Deutsche Meteorologen-Tagung (German Meteorologists Meeting), Berlin, Mar. 16-20, 1992, p.192-193, In German. 5 refs.

The stationary total ozone wave may vary from the average by more than 12 Dobson units, with the lowest levels occurring in January in the Northern Hemisphere and in October in the Southern Hemisphere. Temperature and dynamic wave processes in the lower stratosphere appear to be more significant than photochemical processes. The proposed model simulates wave number 1 well in both hemispheres and wave number 2 as well in the Southern Hemisphere.

Olf, J., **Geostrophic wind and sea ice motion in the Weddell Sea** [Geostrophischer Wind und Meereisbewegung in der Weddell-See], *Deutscher Wetterdienst, Offenbach am Main. Annalen der Meteorologie,* 1992 No.27, Deutsche Meteorologen-Tagung (German Meteorologists Meeting), Berlin, Mar. 16-20, 1992, p.228-229, In German. 4 refs.

Sea ice drift in the Weddell Sea was measured by satellite tracking of Argos drift buoys in October 1986 as part of the Winter Weddell Sea Project 1986. The large-scale structure of the Weddell Gyre may be derived from the ice drift data. The ice drift vector, D, is found from the equation D = AG + M + epsilon, where G and M are the geostrophic wind and ocean current vectors, A is a complex coefficient taking into account the wind factor and the angle between the current direction and the geostrophic wind, and epsilon includes all the other parts of the ice drift vector that are neither constants nor linear functions of the geostrophic wind. Here, A = /A/ e exp -i theta. The average value of /A/ was 0.015 and theta was 3.6.

Dutz, S., Roth, R., **Sensible heat flux over open water and sea ice in the Weddell Sea** [Strom fühlbarer Wärme über offenem Wasser und Meereis in der Weddell-See], *Deutscher Wetterdienst, Offenbach am Main. Annalen der Meteorologie,* 1992 No.27, Deutsche Meteorologen-Tagung (German Meteorologists Meeting), Berlin, Mar. 16-20, 1992, p.317-318, In German. 5 refs.

Sensible heat flux between open water, sea ice, and the atmosphere in the Weddell Sea, was measured by drift buoys from February through July 1989. The heat loss from the ocean through the ice cover to the atmosphere was noticeably less than expected. The average monthly sensible heat fluxes in W/sq m, from February through July, were respectively, 31, 22, 25, 8, -1, and 7. The growth rate of the ice in February was .09 cm/d and in May was only .02 cm/d.

I-46928

Frieden, W., **Turbulent heat exchange between sea ice and the atmosphere in the Weddell Sea (Antarctica)** [Turbulenter Wärmeaustausch zwischen Meereis und Atmosphäre im Weddell-Meer (Antarktis)], *Deutscher Wetterdienst, Offenbach am Main. Annalen der Meteorologie,* 1992 No.27, Deutsche Meteorologen-Tagung (German Meteorologists Meeting), Berlin, Mar. 16-20, 1992, p.338-339, In German. 3 refs.

Turbulent heat exchange between the sea ice and atmosphere was measured in the Winter Weddell Gyre Study 1989. There was only a slight heat flux between the atmosphere and ice from +25 to -35 W/sq m. In late winter, there was an average thermal conductive flux from the ice to the atmosphere of 20-30 W/sq m, indicating an ice growth of 6-9 mm/day. Turbulent flow in the atmospheric boundary layer is strongly affected by the wind velocity and air temperature spectra. The shape of the wind velocity spectra in the inertial subrange corresponds to the 5/3 law of Kolmogorov and the air temperature spectra are strongly suppressed in the inertial subrange.

Rojas, C.M., Van Grieken, R.E., Cantillano, M.E., **Study of antarctic aerosol using X-ray fluorescence and single particle analysis,** *Santiago de Chile. Instituto Antártico Chileno. Serie científica,* 1992 No.42, p.37-45, 17 refs.

During the 24th Chilean Antarctic Expedition a set of 8 aerosol samples was collected at the Bernardo O'Higgins Station. The samples were analyzed by electron-probe X-ray microanalysis (EPXMA) and energy-dispersive X-ray fluorescence (EDXRF). Concentrations of the detected elements (Si, P, S, K, Ca, Fe, Ni, Cu, Zn and Pb) are much higher than those reported in the literature. The aerosol had a predominant marine origin and high Zn concentrations, suggesting the presence of an anthropogenic source such as incineration waste. Individual particle analysis showed that the fine fraction had an average diameter of 0.67 micron, whereas that of the coarse fraction was 5.6 microns. Both fine and coarse mode aerosols presented a log-normal size distribution. (Auth.)

Fuwa, K., **Monitoring of the global environment—Participation of Japan and other Asian countries,** *Pure and applied chemistry,* Apr. 1992 64(4), p.473-484, 20 refs.

Elemental and organic carbons in aerosol samples, collected on board the research vessel *Shirase* during her voyage between Japan and Antarctica through the southwestern Pacific Ocean in 1988, were analyzed. The schematic diagram of the carbon analysis system, and the results, are shown in figures. There was an obvious decrease of both elemental and organic carbons as the ship approached Antarctica, indicating a decrease of total chemical substances released into the air.

Tominaga, T., **Chlorofluorocarbons in the atmosphere: trends and vertical profiles,** *Pure and applied chemistry,* Apr. 1992 64(4), p.529-536, 14 refs.

An extremely clean analytical system has been developed for accurate analysis of atmospheric chlorofluorocarbons, carbon tetrachloride, methyl chloroform and other halocarbons. Atmospheric samples were collected at the surface level in Japan and Antarctica by grab-sampling and analyzed by ECD gas chromatography. The background atmospheric concentrations of CCl3F (CFC-11) and CCl2F2 (CFC-12) in the mid- latitude Northern Hemisphere have been increasing by 4% a year over the past decade. The concentrations of CFC-11 and CFC-12 observed in Antarctica have been 8-10% lower than those observed in the Northern Hemisphere, in accordance with the predominant emission of chlorofluorocarbons in the Northern Hemisphere and the delay (about 2 years) in their diffusion into the Southern Hemisphere across the Intertropical Convergence Zone. The CCl2FCClF2 (CFC-113) concentration in the atmosphere tends to increase much faster than that of CFC-11 or CFC-12. (Auth. mod.)

Lehmann, P., **Investigation into the causes of stratospheric ozone loss in the southern Australasian region,** *Geophysical research letters,* July 24, 1992 19(14), p.1463-1466, 18 refs.

Measurements of total ozone at Macquarie I. reveal statistically significant reductions of approximately 12% during July to Sept. when comparing the mean levels for 1987-90 with those in the seventies. In order to investigate the possibility that these ozone changes may not be a result of dynamic variability of the stratosphere, a simple linear model of ozone was created from statistical analysis of tropopause height and isentropic transient eddy heat flux, which were assumed representative of the dominant dynamic influences. Comparison of measured and modelled ozone indicates that the recent downward trend in ozone at Macquarie I. is not related to stratospheric dynamic variability, and therefore suggests another mechanism, possibly changes in photochemical destruction of ozone. Mak, J.E., Brenninkmeijer, C.A.M., Manning, M.R., **Evidence for a missing carbon monoxide sink based on tropospheric measurements of CO-14,** *Geophysical research letters,* July 24, 1992 19(14), p.1467-1470, 18 refs.

An important problem in atmospheric chemistry is the determination of the oxidative capacity of the troposphere, which provides an index of how quickly trace gas species are destroyed. Central to this question are the abundance and distribution of hydroxyl radical, which is responsible for the destruction of a large proportion of chemical compounds such as CH4, CO, and nonmethane hydrocarbons. CO-14 can be used as a chemical tracer to help constrain the OH concentration, as oxidation via OH is the major sink for all carbon monoxide. The authors present the first CO-14 observations in the free troposphere during different seasons from 90S to 34N. Model simulations suggest that a large increase in the carbon monoxide sink strength may be needed in order to accommodate the experimental results. (Auth.)

Hanson, D.R., **Laboratory studies of stratospheric trace constituents: ozone and nitric acid,** Duluth, University of Minnesota, 1989, 85p., University Microfilms order No. 89-12805, Ph.D. thesis. Refs. passim.

Models have been developed to understand and predict ozone trends in order to determine man-made perturbations to the ozone layer. A major anthropogenic ozone-destroying catalyst is chlorine; it is believed to be responsible for recent depletion of ozone levels at high altitudes globally and also for the antarctic ozone hole. There has been an effort to intercompare balloon-borne ozone monitors, especially at high altitudes, to develop a set of instruments to detect small changes in ozone. An ozone calibration system has been developed that simulates stratospheric ozone concentration. In the process of developing this system, a determination of the vapor pressure of ozone was made at liquid nitrogen temperatures. The pressure was measured to an accuracy within 1%, thus providing a well-known reproducible ozone concentration that can be used as an absolute ozone standard. Results support the claim that chlorine is directly responsible for the ozone hole. (Auth. mod.)

Higashi, A., **Global warming and sea level rise—discussions and report from IPCC workshop,** *Polar news,* Mar. 1991 No.52, p.58-65, In Japanese. 7 refs.

A report on global warming and sea level rise, presented to a 1989 workshop of the Intergovernmental Panel on Climate Change (IPCC), is discussed. Contributing factors to sea level rise accompanying global warming, induced by increasing CO2 concentrations in the atmosphere, are thermal expansion of sea water and the accelerated melting of the antarctic and Greenland ice sheets and other glaciers throughout the world. The major factor is the antarctic ice sheet with its 29,-330,000 cu km of ice which would raise the world sea level 65 m if it were all melted. The Greenland ice sheet with 2,950,000 cu km of ice would raise the world sea level an additional 7 m. If CO2 concentrations continue to increase at their current rate and average air temperatures increase 1.5, 2.5, or 4.5 C, the predicted rise in sea level is respectively, 8, 18, or 29 cm by the year 2030, and 31, 66, or 110 cm by the year 2100.

Loureiro, A.L.M., Vasconcellos, M.B.A., Pereira, E.B., **Trace element determination in aerosols from the Antarctic Peninsula by neutron activation analysis,** *Journal of radioanalytical and nuclear chemistry, articles,* May 1992 159(1), p.21-28, 14 refs.

Knowledge of the composition of atmospheric aerosols in remote areas, such as the Antarctic Peninsula, is of great importance for the study of long-range transport of atmospheric contaminants and also from the climatological perspective. In the present work, instrumental neutron activation analysis was applied to determine the presence of various chemical elements in aerosol samples collected in the region of the Comandante Ferraz Station on King George I. Sea and soil were identified as the major sources of aerosols in the collected samples. (Auth. mod.)

Martinerie, P., **Physical and climatic parameters which influence the air content in polar ice,** *Earth and planetary science letters,* Aug. 1992 112(1/4), p.1-13, 22 refs.

Under present climatic conditions, the air content of polar ice *(V)* generally shows a high sensitivity to the atmospheric pressure and hence to the surface elevation of the ice sheet where the ice is formed. The results presented here are from 16 different sites (14 in Antarctica, one in Greenland and one in the Yukon Territory, Canada), and they allow a better understanding of the parameters which influence the air content in ice. It is demonstrated that *V* can be expressed very simply as a function of the atmospheric pressure *(Pi),* the temperature *(Ti)* and the porous volume of ice *(Vi)* at which the air in the firn becomes isolated in terms of pressure from the atmosphere during the process of pore close-off. Results confirm a *Vi* increase with temperature and show no clear *Vi* dependence on snow accumulation rate. The possible non-linearity of the *Vi-Ti* relation obtained could be due to a wind influence on *Vi* and/or to a second-order effect of the accumulation rate. The *Vi* results are compared to measurements of the volume of closed pores versus depth in the firn. In closing, the authors discuss the parameterization that can be obtained to interpret the air content variations observed in deep ice cores (over periods covering glacial-interglacial transitions) in terms of paleoclimatic conditions prevailing at the surface of the ice sheet. Obleitner, F., **Atmospheric turbidity at the antarctic coastal station Georg-von-Neumayer (70S, 8W, 40 m MSL),** *Journal of applied meteorology,* Oct. 1992 31(10), p.1202-1209, 36 refs.

Spectral actinometric measurements of direct solar radiation were made at the Georg von Neumayer Station on all 17 clear days during 1981/82. From broadband measurements using cutoff filters, a number of common measures for aerosol extinction as well as precipitable-water content of the atmosphere were derived by numerical analysis. Average Angström turbidity coefficient, wavelength exponent, aerosol optical depth, and mean precipitable water were determined, matching the regional pattern known until now. Monthly as well as daily variations of observed atmospheric turbidity are discussed with respect to prevailing winds, synoptic patterns, and topography, revealing lowest turbidity for southwesterly flow. A review of 30 years of compatible aerosol optical thickness measurements at antarctic coastal stations is included. (Auth. mod.)

Hofmann, D.J., **Observation and possible causes of new ozone depletion in Antarctica in 1991,** *Nature,* Sep.24, 1992 359(6393), p.283-287, 23 refs.

Local ozone reductions approaching 50% in magnitude were observed during the antarctic spring in the 11-13 and 25-30 km altitude regions over South Pole and McMurdo Stations in 1991. These reductions, at altitudes where depletion has not been observed previously, resulted in a late September total ozone column 10-15% lower than previous years. The added depletion in the lower stratosphere was observed to coincide with penetration into the polar vortex of highly enhanced concentrations of aerosol particles from volcanic activity in 1991.

Larson, S.H.H., Hendricsen, K., **Antarctic "ozone hole" compared to ozone behavior in the Arctic,** *Geomagnetism and aeronomy,* 1991 31(3), p.384-387, Translated from Geomagnetizm i aeronomiia. 10 refs.

Data characterizing the formation of the ozone hole in Antarctica are discussed. The ozone hole is a reduction in the total ozone concentration in the atmosphere from 300 Dobson units (D.u.) during the International Geophysical Year (1957-1958) to 120 D.u. in Sep.-Oct. 1987. In 1988 the ozone concentration near the ozone hole jumped significantly, to 210 D.u. Phenomena similar to the ozone hole have not been observed in the Arctic. The decisive factors in the formation of the ozone hole include low temperatures, polar stratospheric clouds, and solar radiation. Chlorine from both anthropogenic and natural sources also plays a determinant role. (Auth.)

Fiocco, G., Cacciani, M., Di Girolamo, P., Fuà, D., **Stratospheric clouds at South Pole during 1988. 1. Results of lidar observations and their relationship to temperature,** *Journal of geophysical research,* Apr. 20, 1992 97(D5), p.5939-5946, 21 refs.

An optical radar—lidar—has been operational at the Amundsen-Scott South Pole Station since summer 1987-1988. The observations were specially directed to the detection of aerosol layers and polar stratospheric clouds (PSCs). The lidar utilized a Nd-YAG laser followed by a second harmonic generator, and a 0.5 m diameter Cassegrain receiving telescope. Results obtained during the period May-Oct. 1988 are summarized. Some 10,000 profiles of the lidar echoes, each the result of 1-min averaging, were obtained. Data sets consisting of profiles of the scattering ratio and of the backscattering cross section *Ba,* based on half-hour averaging, are presented. The data can be related to profiles of the atmospheric temperature *T,* usually obtained on a daily basis at South Pole. Stratifications appear to have two distinct types of structures: one structure shows only a modest variation with height; the other is characterized by sharp features, with large changes of the cross section with height. The basic results, the relationship between *Ba* and *T,* and their statistical relevance are considered in this paper. The microphysical interpretation, the attribution of these structures to PSC Type 1 and Type II, respectively involving the condensation of nitric acid trihydrate and of water ice, and the seasonal evolution of the phenomena are treated in a companion paper. (Auth.)

Fuà, D., **Stratospheric clouds at South Pole during 1988. 2. Their evolution in relation to atmospheric structure and composition,** *Journal of geophysical research,* Apr. 20, 1992 97(D5), p.5947-5952, 7 refs.

A lidar was installed at the Amundsen-Scott South Pole Station in the austral summer 1987-1988; aerosol layers, generically identified as polar stratospheric clouds, were frequently observed in the period May-Oct. 1988 through the altitude range 8-20 km. On the basis of previous work the behavior of the aerosol backscattering cross section *Ba* has been related to the temperature *T* through linear fits between the two variables. The resulting coefficients, namely the slope *b=dBa/dT* and *Tf,* the temperature at which the onset of condensation occurs, help to classify these clouds as Type I or II, in view of the thermodynamic properties of the condensing species. A strong dependence of *Ba* on *T,* represented by a large value of *b,* is interpreted as evidence of ice condensation and leads the authors to identify the cloud as Type II, while a lower value of *b,* characteristic of diffuse structures, is taken as evidence for Type I clouds, composed of nitric acid trihydrate. The evolution of these features is reported. Type II clouds, appearing as sharp layers of moderate vertical extent, are almost always present in the interval from June to early Sep. The temperature at the base of the lowest layer spans an initial value around 198 K to a final value in Sep. around 196 K, with a corresponding height value from around 13.5 km to 10.5 km. Layers that are identified as Type I clouds appeared at higher temperatures with an onset at the beginning of the season around 200 K to a final value at mid-Oct. around 203 K. (Auth.)

Fisher, D.A., **Stable isotope simulations using a regional stable isotope model coupled to a zonally averaged global model,** *Cold regions science and technology,* Sep. 1992 21(1), p.61-77, 46 refs.

A global zonally averaged stable isotope model is reviewed, checked and used to give input to a regional model that uses precipitation along assumed vapor trajectories to predict (delta)O-18 and deuterium excess in Arctic Canada, NW Greenland, Central Greenland, East Antarctica, Victoria Land and on the Ross Ice Shelf. Where there is predominantly a single moisture trajectory, the model works well, but it does not fit the data in regions like Central Greenland (Crête) that would seem to have no predominant regional moisture path. Cloud supersaturation, seasonal precipitation and the temperature at which clouds shift from water droplets to ice crystals are emphasized. (Auth. mod.)

Rudolph, J., Khedim, A., Clarkson, T., Wagenbach, D., **Long-term measurements of light alkanes and acetylene in the antarctic troposphere,** *Tellus,* Sep. 1992 44B(4), p.252-261, 26 refs.

Between 1982 and 1989, biweekly whole air samples were collected at the Georg von Neumayer Station. A smaller number of samples were taken in 1988 and 1989 at Scott Base. These samples were analyzed for several light hydrocarbons and halocarbons. For the light alkanes and acetylene, the average results from the two stations, which are located on opposite coasts of Antarctica, agree. The annual mean values for ethane, propane, n-butane, i-pentane and acetylene are 380 +/- ppt, 84 +/- 4 ppt, 50 +/- 4 ppt, 15 +/- 2 ppt, and 17 +/- 1 ppt, respectively. The mixing ratios of ethane, propane, and i-pentane show a seasonal cycle with a peak in Aug., a minimum in Feb. and an average maximum to minimum variation of 40-50%. Acetylene also shows a maximum around Aug., but its seasonal variation is higher by a factor of three. For ethane, propane and acetylene, the measurements indicate that during the last few years, the average mixing ratios in austral winter have slightly increased. A possible explanation of this secular trend is the increase of biomass burning in the Southern Hemisphere. This is also consistent with the assumption that part of the seasonal variation found for ethane, propane and acetylene reflects the seasonal dependence of biomass burning. (Auth.)

Murayama, S., **Variations of tropospheric ozone concentration over Syowa Station, Antarctica,** *Tellus,* Sep. 1992 44B(4), p.262-272, Refs. p.271-272.

Aircraft measurements of tropospheric O3 concentration were made over Showa Station from May 1989 to Jan. 1990, except during the polar night months of June and July. The O3 concentration increased with height for the whole period of the measurements. Lower tropospheric O3 showed a prominent seasonal variation with maximum concentration in winter and minimum concentration in summer, which is very close to the result of continuous O3 measurements initiated at Showa Station in Feb. 1988. In the upper troposphere, the concentration reached high values in winter, decreased gradually until late spring and then increased again. As a result, the height-dependent difference of the concentration was reduced from late autumn to early spring and enhanced in remaining seasons of the year. The seasonal variation of upper tropospheric O3 was similar to those of the lower stratospheric O3 concentration measured by ozonesondes and the total amount of O3 by a Dobson spectrophotometer over Showa Station. It is suggested that air with low O3 concentrations is transported from subpolar or middle latitudes to Showa Station through the lower troposphere from spring to early autumn, in addition to the photochemical destruction of O3 near the station. (Auth. mod.)

Aoki, S., Nakazawa, T., Murayama, S., Kawaguchi, S., **Measurements of atmospheric methane at the Japanese antarctic station, Syowa,** *Tellus,* Sep. 1992 44B(4), p.273-281, 21 refs.

Precise and continuous measurements of atmospheric CH4 concentration were initiated at Showa Station in Feb. 1988, using a gas chromatograph equipped with a flame ionization detector. The measurement precision was typically 0.07% in a concentration range of 0.5 to 2.5 ppmv. The standard gases were CH4-in-air mixtures and their CH4 concentrations were determined gravimetrically with uncertainties of 0.2%. The CH4 concentrations measured at the station were extremely stable, and outliers due to local contamination such as station activities were not found. A diurnal CH4 variation was hardly observable throughout the year. The average seasonal CH4 variation showed minimum and maximum concentrations in early Mar. and late Sep., respectively, and a peak-to-peak amplitude of 30 ppbv. Annual mean values of the CH4 concentration were 1640 and 1651 ppbv in 1988 and 1989, respectively. A concentration difference of 11 ppbv between the two years may suggest that the recent annual increase rate of CH4 concentration is smaller than previously reported values of about 1%/year. (Auth.)

Etheridge, D.M., Pearman, G.I., Fraser, P.J., **Changes in tropospheric methane between 1841 and 1978 from a high accumulation-rate antarctic ice core,** *Tellus,* Sep. 1992 44B(4), p.282-294, Refs. p.292-294.

To determine in detail how the concentration of tropospheric methane has changed from pre-industrial until recent times, an ice core with remarkably fine air-age resolution was investigated. The core, called DE08, contains air from as recent as 1978 with an age resolution of about 14 years. It was drilled from a region of Law Dome with extremely high snow-accumulation rate. The ice chronology was determined from the observed chemical and isotopic seasonal variations, verified against a volcanic horizon. The mean air-age was 35 years younger than the host ice except for air in summer ice layers, which was 37 years younger than the host ice. The extracted ice-core air was analyzed for methane using gas chromatography with flame-ionization detection. Methane concentrations in the DE08 record increased from 823 parts per billion by volume (ppbv, in dry air) in 1841 to 1481 ppbv in 1978. The DE08 record shows that methane growth rates have generally increased since the onset of the industrial revolution to a level of 14 ppbv/year (about 1% per year) by the 1970s. The exception was between about 1920-1945 when the growth rate stabilized at about 5 ppbv/year. (Auth. mod.)

Guerzoni, S., **Geochemistry of airborne particles from the lower troposphere of Terra Nova Bay, Antarctica,** *Tellus,* Sep. 1992 44B(4), p.304-310, 29 refs.

Major and trace constituents (soluble + insoluble) of wind-blown particles collected at Terra Nova Bay were studied and the data compared with lacustrine and marine sediments from the same area and the Ross Sea. Compared to the geochemical composition of the other local sediments, the aerosol was found to be slightly enriched in femic minerals and depleted in Si. The Transantarctic Mountains (granitoids and metamorphic rocks) are proposed as the main source of the large (D>4 microns) insoluble particles, with a possible contribution from nearby volcanoes. The soluble fraction accounts for more than 2/3 of the total mass loading and is mainly composed of marine salts. Some traces of contamination due to emissions from human activities were found in the aerosol, with mean Pb enrichment factor (EFcrust) value of 181. Crustal Pb contribution accounts for less than 10%, marine Pb less than 0.01% and 90% of Pb is unaccounted for. (Auth.)

Artaxo, P., Rabello, M.L.C., Maenhaut, W., Van Grieken, R.E., **Trace elements and individual particle analysis of atmospheric aerosols from the Antarctic Peninsula,** *Tellus,* Sep. 1992 44B(4), p.318-334, Refs. p.331-334.

Atmospheric aerosols have been sampled continuously since Dec. 1985 at the Comandante Ferraz Station. The concentration of elements with Z>10 was measured by particle-induced X-ray emission (PIXE) analysis. This yielded data for the concentration of 23 elements: Na, Mg, Al, Si, P, S, Cl, K, Ca, Ti, V, Cr, Mn, Fe, Ni, Cu, Zn, Se, Br, Rb, Sr, Zr and Pb. The fine and coarse aerosol mass concentration was determined by gravimetric analysis. Absolute principal factor analysis (APFA) was used to obtain the aerosol elemental source profiles. Non-sea-salt sulfate showed a clear seasonal pattern, with minimum during wintertime. For summer and wintertime coarse particles, only two factors were significant, with the first having high loadings for Na, Mg, Cl, S, Sr, K, Ca and the coarse particle mass concentration (representing sea-salt aerosol). The second factor had high loadings for Al, Si, Fe, Ti, and Ca (soil dust aerosol). For the fine mode particles, three factors were differentiated, and they represented sea-salt aerosol, soil dust and sulfates. The sea-salt source profile agreed with the average sea-water elemental composition to within 20% for the elements Na, Mg, S, Cl, K, Ca and Br. (Auth. mod.)

Delmas, R.J., Kirchner, S., Palais, J.M., Petit, J.R., **1000 years of explosive volcanism recorded at the South Pole,** *Tellus,* Sep. 1992 44B(4), p.335-350, Refs. p.349-350.

Cataclysmic volcanic eruptions generally disturb the global atmosphere markedly for around 2 years. During that time, long-life volcanic products (mainly H2SO4), stored in the stratosphere gradually return to the troposphere. Antarctic snow may be subsequently contaminated and acid signals recorded. The recovery of these signals along antarctic ice cores provides a history of past volcanic events, most often of global, but sometimes of just regional, significance. Several physical and chemical techniques have been used to analyze a 1000-year ice core drilled near Amundsen-Scott Base. Acid and ultrafine ash deposits of volcanic origin have been carefully investigated. 23 major volcanic eruptions have been detected, dated and tentatively identified. The results have been compared with similar antarctic and Greenland records. The amount of volcanic sulfate deposited in antarctic snow, calculated and averaged over the last millennium, is, however, minor (13% of the total sulfate) in comparison with that of marine biogenic source. The 19th century was the period of the millennium most seriously disturbed by global explosive volcanic activity. The chlorine cycle, as recorded in antarctic ice, seems to be little affected even by such a large event as Tambora in 1815. (Auth.)

Law, R., Simmonds, I., Budd, W.F., **Application of an atmospheric tracer model to high southern latitudes,** *Tellus,* Sep. 1992 44B(4), p.358-370, 22 refs.

The development of a global three-dimensional tracer model is discussed. It is used to examine the atmospheric dispersal of passive tracer gases, particularly carbon dioxide, and their transport to Antarctica and the southern ocean. The tracer model is based on the University of Melbourne General Circulation Model and includes the effect of convective transport. Results indicate the importance of a realistic treatment of the effect of convection. The model is applied to the dispersion of idealized distributions of tracer to determine atmospheric transport times, particularly the time taken for the "trace front" to reach the antarctic coast and the South Pole in the case of clouds initialized at three latitudinal domains. The transport in all cases is seen to be very rapid south of about 45S; this is due to the mixing associated with the strong and numerous transient disturbances at these latitudes in the Southern Hemisphere. The model is also used with an inverse technique and an annual mean carbon dioxide type distribution to deduce apparent sources and sinks of this gas. (Auth. mod.)

Genthon, C., **Simulations of desert dust and sea-salt aerosols in Antarctica with a general circulation model of the atmosphere,** *Tellus,* Sep. 1992 44B(4), p.371-389, Refs. p.387-389.

A coupled aerosol/climate model, elaborated on the basis of a general circulation model of the atmosphere, is used to study the features of desert dust and sea-salt aerosols in the antarctic region. Some of the observed seasonal characteristics of the two tracers are well simulated, and they are interpreted in terms of their relations with components of the atmospheric circulation. The model exhibits a strong influence of the boundary layer stability on the aerosols' vertical distributions near the surface. Observation at surface level may therefore be very misleading with respect to concentrations and seasonal variability higher in the atmosphere. An ice age experiment is run with the same aerosol/climate model, but fails to reproduce an expected large increase of dust and sea-salt concentrations in surface snow. The simulated enhancements of the production rates and atmospheric transport efficiency are weak. Changes in the distribution of the sources of dust, ignored in the experiment, could therefore have largely contributed to the last ice age dust increase. (Auth. mod.)

Nogués-Paegle, J., Mo, K.C., Callahan, K.P., **Lower stratosphere waves during 1986-1989 southern springs,** *Tellus,* Sep. 1992 44B(4), p.390-408, 13 refs.

This paper describes the horizontal structure of ozone and 50 mb height waves for the 1986-1989 springs of the Southern Hemisphere, using global NMC height analyses and Nimbus 7 TOMS Grid-T Version 6 data. Empirical Orthogonal Functions (EOFs) are obtained for the ozone and height data independently to identify the meridional structure of observed long waves as well as their propagation characteristics. It is found that the leading EOFs for both the ozone and 50 mb height waves exhibit wavenumber 1 and 2 patterns. The wave 1 pattern is usually centered at 60-65S and it either propagates eastward with a period of 30 days or longer (1986, 1987, 1989) or it is quasi-stationary (1988). This wave was weak during 1987, a year with low ozone values which persisted into summer. The wave 2 pattern travels eastward with a period of 10-12 days. The observed total ozone amplitudes for waves 1 and 2 for most years are consistent with the total ozone predictions by the wave model. In contrast, during 1989, a year with a well-defined vertically propagating wave 1, the linear model overpredicts the observed ozone wave amplitude by a factor of 2. (Auth. mod.)

Harris, J.M., **Analysis of 5-day midtropospheric flow patterns for the South Pole: 1985-1989,** *Tellus,* Sep. 1992 44B(4), p.409-421, 21 refs.

In a study of 5-day midtropospheric flow patterns for the South Pole during 1985-1989, cluster analysis was used to summarize trajectories by year and by month. The results indicate that flow from the east was most often anticyclonic and light, occurring 8-18% of the time. Westerly flow patterns were the strongest and most frequent (37-51% occurrence). They were consistently cyclonic, usually reflecting storms in the Ross Sea area. Strong northerly flow occurred more often in 1987 than in other years. Year-to-year variability was also evident in southwesterly flow, which was enhanced in 1988, and weaker in 1987, compared with other years. The lightest winds over the South Pole occur during Jan., while the most vigorous long-range transport to South Pole occurs from July through Oct. Isentropic trajectories from the east showed little vertical motion and good agreement with isobaric ones. Over west Antarctica, however, isentropic trajectories consistently showed positive vertical motion. As a result, their isobaric counterparts were too long, and thus overestimated the cyclonic curvature in the flow. Preferred transport from the west with warm-air advection results from the circumpolar vortex being asymmetrical, and the average isotherms, though roughly circular, being offset to the east of the South Pole. (Auth. mod.)

Argentini, S., Mastrantonio, G., Fiocco, G., Ocone, R., **Complexity of the wind field as observed by a sodar system and by automatic weather stations on the Nansen Ice Sheet, Antarctica, during summer 1988-1989: two case studies,** *Tellus,* Sep. 1992 44B(4), p.422-429, 13 refs.

In the antarctic boundary layer, some phenomena appear to be particularly enhanced with respect to those at midlatitudes. Thermal stratifications are present almost all year and can sustain drainage flows of different types. Several episodes of flows with different potential temperature and consequently with different buoyancy were observed on the Nansen Ice Sheet by a sodar. Two case studies are presented in which a comparison with the data of the automatic weather stations located on the Reeves and the Priestley glaciers as well on the Nansen Ice Sheet have been used. Results show that during summer, the flow from the Reeves Glacier may superimpose the one from the Priestley. Also, an episode of barrier-katabatic flow interaction is shown in which the first is negatively buoyant in comparison with the second. The wind profile frequently shows increased variability with height. (Auth. mod.)

Peel, D.A., Mulvaney, R., **Time-trends in the pattern of ocean-atmosphere exchange in an ice core from the Weddell Sea sector of Antarctica,** *Tellus,* Sep. 1992 44B(4), p.430-442, Refs. p.441-442.

The east coast of the Antarctic Peninsula is strongly influenced by air masses that have traversed the Weddell Sea zone. A continuous record of annual-average values for delta O-18, delta D, Cl and non sea-salt sulphate ion in snowfall deposited since 1975 has been obtained on an ice core drilled on Dolleman I. Chemical changes along the ice core seem to be linked to changes in the concentration of the ice cover in the marginal ice zone. In the period since 1956, these variations appear to be coupled to the atmospheric circulation, as indexed by the atmospheric pressure gradient across the marginal ice zone. The largest anomaly in the 200-year sequence occurs in the period 1820-1880, during the final stages of the Little Ice Age. During the past century, there has been a marked decrease in deuterium excess of about 4 per mill. The implication is that there may have been significant weakening of the ice cover in this zone during the past century, despite satellite evidence which reveals no significant change in the position of the ice edge, at least since 1973. (Auth. mod.)

Gil, M., Cacho, J., **NO2 total column evolution during the 1989 Spring at Antarctic Peninsula,** *Journal of atmospheric chemistry,* Aug. 1992 15(2), p.187-200, 32 refs.

Ground-based visible differential absorption spectrometry during twilight has been used for NO2 total column observations at the Antarctic Peninsula, Marambio Base, during the austral spring of 1989. Results show moderate NO2 vertical column levels of 1.5 to 2.5 x 10(sup 15) molec/sq cm in the morning and 2 to 3 x 10(sup 15) molec/sq cm in the evening until middle October, highly modulated by planetary wave activity. From that date until the end of the period, a steady increase occurs which is associated with the rising of lower stratosphere temperature as the vortex weakens, reaching values of 5 x 10(sup 15) molec/sq cm in late November, with small a.m.-p.m. differences. NO2 is found to be positively correlated to both total ozone and 50 hPa temperature during the entire spring. However, when analyzing the departures from linear trends, a highly negative correlation has been observed from day 301 onwards. (Auth.)

Deshler, T., **Volcanic aerosol and ozone depletion within the antarctic vortex during the austral spring of 1991,** *Geophysical research letters,* Sep. 23, 1992 19(18), p.1819-1822, 16 refs.

In the spring of 1991 the antarctic lower stratosphere was characterized by a layer of volcanic aerosol from the Cerro Hudson eruption. This aerosol layer was observed from McMurdo Station with both lidar and balloonborne particle counters beginning around Sep. 10. After Sep. 20 the aerosol was observed daily at between 9 and 13 km. In this layer homogeneous nucleation of new aerosol was observed with concentrations >6000/cu cm. Comparisons of scattering ratio calculated from measured particle size distributions agree best with the lidar measurements when a real index of refraction near 1.5 is used. In the past 5 years of measurements, ozone below 13 km has been relatively unchanged during the annual antarctic ozone depletion; however, in 1991 ozone below 13 km decreased at a rate of 4-8 ppb/day over 30 days. This change began shortly after the appearance of the volcanic aerosol, providing direct measurements correlating volcanic aerosol and ozone depletion. (Auth.)

Joshi, P.V., **Distribution of atmospheric ions and Aitken nuclei over southern oceans and polar regions,** *Environment international,* 1992 18(4), p.417-425, 37 refs.

In the Eighth Indian Antarctic Expedition, measurements of atmospheric ions and Aitken nuclei were carried out over southern oceans and at an oasis in Antarctica. The levels decrease towards high latitudes and are log-normally distributed. Based on these data, some inferences have been made and background levels of both the species are described. Their dependence on background levels is discussed. At background levels, the inverse relationship between atmospheric ions and Aitken nuclei may not hold.

Bromwich, D.H., Carrasco, J.F., Stearns, C.R., **Satellite observation of katabatic-wind propagation for great distances across the Ross Ice Shelf,** *Monthly weather review,* Sep. 1992 120(9), p.1940-1949, 23 refs.

Five winter months (Apr.-Aug. 1988) of thermal infrared satellite images were examined to investigate the occurrence of dark (warm) signatures across the Ross Ice Shelf. These features are inferred to be generated by katabatic winds that descend from southern Marie Byrd Land and then blow horizontally across the ice shelf. Significant mass is added to this airstream by katabatic winds blowing from the major glaciers that flow through the Transantarctic Mountains from East Antarctica. These negatively buoyant katabatic winds can reach the northwestern edge of the shelf, a horizontal propagation distance of up to 1000 km, 14% of the time. Where the airstream crosses from the ice shelf to the ice-covered Ross Sea, a prominent coastal polynya is formed. Because the downslope buoyancy force is near zero over the Ross Ice Shelf, the northwestward propagation of this katabatic air mass requires pressure gradient support. The study shows that the extended horizontal propagation of this atmospheric density current occurs in conjunction with the passage of synoptic cyclones over the southern Amundsen Sea. These cyclones can strengthen the pressure gradient in the interior of West Antarctica and make the pressure field favorable for northwestward movement of the katabatic winds from West Antarctica across the ice shelf in a geostrophic direction. The glacier winds from East Antarctica are further accelerated by the synoptic pressure gradient, usually undergo abrupt adjustment beyond the exit to the glacier valley, and merge into the mountain-parallel katabatic air mass. Josefsson, W.A.P., **Focused sun observations using a Brewer ozone spectrophotometer,** *Journal of geophysical research,* Oct. 20, 1992 97(D14), p.15,813-15,817, 7 refs.

Accurate measurements of total ozone at high latitudes during winter have become increasingly important for studies of polar ozone depletion. The direct sun measurements are the most direct and physically well-defined type of measurement of total ozone with Dobson and Brewer spectrophotometers along with the focused sun measurements. The direct sun and focused sun method are influenced by many sources of error at low solar elevations. A large error arises from the addition of radiation scattered from air along the path of the solar beam. A method to correct for this error using the Brewer instrument is described. The method gives reasonably accurate values down to solar elevations of 5 deg, compared to 10-20 deg without corrections. This is especially important for high-latitude stations, where the low solar elevations are a limiting factor for accurate measurements of the total ozone, particularly during the winter. (Auth. mod.)

I-47358

Folkins, I., Brasseur, G., **Chemical mechanisms behind ozone depletion,** *Chemistry and industry,* Apr. 20, 1992 No.8, p.294-297, 13 refs.

The use of chlorofluorocarbons has diminished stratospheric ozone by 3% over the last 10 yr. The ozone layer is created as oxygen molecules absorb ultraviolet energy from the sun at altitudes of 15-40 km. The reaction is reversible, however, and lower energy levels of ultraviolet energy can cause the breakdown of the ozone molecule into an oxygen molecule and a free oxygen atom. The ozone breakdown can also cause chemical combination with other elements present in the stratosphere, such as nitrogen, hydrogen, and chlorine. A variety of chemical reactions involved in the breakdown of the ozone molecule are described, as are the consequences of a transparent atmosphere. Of principle concern is the effect of UV-B radiation on humans, crop yield, and phytoplankton.

Leuenberger, M., Siegenthaler, U., **Ice-age atmospheric concentration of nitrous oxide from an antarctic ice core,** *Nature,* Dec. 3, 1992 360(6403), p.449-451, 33 refs.

Previous studies on polar ice cores showed that the concentrations of the greenhouse gases CO2 and CH4 were significantly reduced during the last glacial period relative to Holocene values. But no comparable studies have been reported for nitrous oxide (N2O), which is the next most important greenhouse gas and also affects stratospheric ozone and, potentially, the oxidative capacity of the troposphere. Reported here are results from antarctic ice cores, showing that the atmospheric N2O concentration was about 30% lower during the last glacial maximum than during the Holocene epoch. These data also show that present-day N2O concentrations are unprecedented in the past 45 kyr, and hence provide evidence that recent increases in atmospheric N2O are of anthropogenic origin. (Auth. mod.)

Mulvaney, R., **Ratio of MSA to non-sea-salt sulphate in Antarctic Peninsula ice cores,** *Tellus,* Sep. 1992 44B(4), p.295-303, 21 refs.

Methane sulphonic acid (MSA) in an ice core from Dolleman I. shows significantly high concentrations compared to values recorded in ice cores and in snowfall from elsewhere in Antarctica. MSA data from two other higher altitude Antarctic Peninsula ice cores, Dyer Plateau and Gomez Nunatak, show that the high concentrations measured at Dolleman I. are not representative of the Peninsula region as a whole. Exceptionally high concentrations observed at Dolleman I. may be related to its proximity to the biologically productive Weddell Sea, an important source of dimethyl sulphide (DMS), the precursor of MSA. The MSA data from this site are also unusual in that in deeper sections of this core they demonstrate a well-defined seasonal maximum in winter rather than in summer, and are out of phase with non sea-salt sulphate, another product of the decomposition of DMS. In contrast, in a near-surface section, MSA variations are in phase with non sea-salt sulphate, with a maximum concentration in the summer layer. A change in the season of deposition of MSA from winter to summer in the recent past is not considered likely. An alternative explanation is that there has been a relocation of the MSA from summer to winter layers during burial. (Auth. mod.)

Marotzke, J., Willebrand, J., **Multiple equilibria of the global thermohaline circulation,** *Journal of physical oceanography,* Sep. 1991 21(9), p.1372-1385, 40 refs.

A general circulation model with a highly idealized geometry is used to investigate which fundamentally different equilibria of the global thermohaline circulation may exist. The model comprises two identical basins representing the Atlantic and Pacific Oceans, which are connected by a circumpolar channel in the south. The model circulation is driven, in addition to wind forcing, by restoring the sea surface temperature to prescribed values and specified freshwater fluxes in the surface salinity budget (mixed boundary conditions). The boundary conditions are symmetric with respect to the equator and identical for both oceans. Four fundamentally different, stable steady states are found under the same set of boundary conditions. Two of the equilibria show both oceans in the same state, with high-latitude deep-water formation occurring either in both northern or in both southern oceans, respectively. Two additional equilibria exist in which the thermohaline circulations of the basins differ fundamentally from each other. One ocean forms deep water at northern high latitudes, while the other has a much weaker circulation with sinking in the Southern Hemisphere. One of these equilibria qualitatively corresponds to today's global thermohaline circulation pattern (conveyor belt). The study is centered on the Equator and data are presented for as far as 64 deg both north and south thereof. The two hemispheres are compared throughout at various parameters and states of equilibrium. (Auth. mod.)

Crowley, T.J., Baum, S.K., **Estimating Carboniferous sea-level fluctuations from Gondwanan ice extent,** *Geology,* Oct. 1991 19(10), p.975-977, 21 refs.

The magnitude of Carboniferous sea-level fluctuations is not well known, but the estimates are important for constraining cyclothem models. In this paper area-volume relations developed for Quaternary ice sheets are applied to estimate the glacio-eustatic component of sea-level fluctuations in the Carboniferous. By utilizing the best estimate of Gondwanan ice area at the time of its greatest extent, a figure of 60 m is estimated for the isostasy-corrected glacio-eustatic component. This value is nearer the lower limit of sea-level estimates for cyclothem fluctuations from other sources. Antarctic areas included in the study are shown in the figures and tables and are discussed in the text. (Auth. mod.)

Bird, J., **Supercomputer voyages to the southern seas,** *Science,* Nov. 1, 1991 254(5032), p.656-657.

This news item provides a progress report on two research groups seeking to develop a model for the Antarctic Circumpolar Current and its interactions with other localized currents, particularly the Agulhas Current and the Gulf Stream. Of especial interest are the effects of these interactions on climates in other parts of the globe far removed from the points of interaction. The anticipated publication from these efforts is an atlas of ocean circulation. The most difficult problem at this stage is the unavailability of a computer sufficiently swift and powerful to afford expeditious handling of the data mass.

Nicholls, K.W., Makinson, K., Robinson, A.V., **Ocean circulation beneath the Ronne ice shelf,** *Nature,* Nov. 21, 1991 354(6350), p.221-223, 16 refs.

Water modified by passage under ice shelves, particularly in the Weddell Sea, is believed to be an important constituent of Antarctic Bottom Water. Antarctic Bottom Water is both cold and oxygen-rich, and plays an important part in the cooling and ventilation of the world's oceans. Because of the difficulty in gaining access, the oceanographic regime beneath ice shelves is very poorly sampled. By successfully drilling through the ice, however, oceanographic data were obtained from beneath the largest antarctic ice shelf, the Ronne-Filchner ice shelf in the southern Weddell Sea. The authors' data agree well with the predictions of a relatively simple oceanographic plume model of sub-ice shelf circulation. This model can therefore be used with some confidence to investigate the links among climate changes, ice-shelf melting and bottom-water production. (Auth. mod.)

Kock, K.H., **State of exploited fish stocks in the southern ocean—a review,** *Archiv für Fischereiwissenschaft,* Aug. 1991 41(1), p.1-66, With German summary. 54 refs.

Antarctic finfish resources have been subject to exploitation primarily by the Soviet Union for more than 20 years. The total yield from the southern ocean has been 2.85 million tonnes until the season 1989/90. About two thirds of the catches have been taken in the Atlantic Ocean sector (mainly South Georgia) while the remaining one third originated primarily from the Kerguelen waters in the Indian Ocean sector. The fishery has been regulated under the auspices of CCAMLR for the whole southern ocean since 1982, and under

French national jurisdiction around the Kerguelen and the Crozet Is. Apart from the lanternfish *Electrona carlsbergi,* the fishery on all other species is restricted by conservation measures. The stocks most heavily affected by fishing are those of *Notothenia rossii* in both sectors, *Notothenia squamifrons* in the Indian Ocean sector and of *Champsocephalus gunnari* in the South Orkney Islands/Antarctic Peninsula region. Most of these stocks are now only small fractions of their initial sizes. *C. gunnari* around South Georgia has recovered two times from low stock sizes following heavy fishing. (Auth.)

Brun-Cottan, J.C., Auger, R., Lambert, C.E., Chesselet, R., **Sources and transport of suspended calcites in Pacific Deep Water,** *Journal of marine research,* Aug. 1991 49(3), p.543-564, Refs. p.562-564.

Significantly large concentrations of suspended matter, especially calcites, are found at some locations in the Deep Pacific, particularly at the depth of the Pacific Benthic Thermocline. These particle-rich layers cannot be explained by simple classical settling processes nor by resuspension of the underlying sediment. A theoretical approach based on these data, on the hydrodynamic characteristics of the regional circulation and on some known physical and chemical parameters, leads the authors to postulate two possible mechanisms: the settling of large particles from surface waters and their preferential disaggregation at some specific depth, particularly at the Pacific Benthic Thermocline depth; or alternatively, the resuspension at those depths of old calcareous sediments from the flanks of East Pacific Rise associated with a horizontal advective diffusive transport mechanism. New chemical and electron-microscope analyses of GEOSECS samples lead to the conclusion that the resuspension mechanism is the most probable. (Auth. mod.)

Ventajas, L., **Relationship between polynucleate hydrocarbon concentration profiles and submarine subsoil** [Relación entre los perfiles de concentración de hidrocarburos polinucleados y subsuelo submarino], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1991 No.385, p.13-33, In Spanish with English, French and German summaries. 5 refs.

A study of polynucleate hydrocarbon concentration profiles versus sea depth was conducted in water samples obtained at 30 different locations in 1984-1986. In the proximity of Marambio Station and in the Bransfield Strait, the graphs of polynucleate hydrocarbon concentration versus time at different depths show greater concentration values in shallow and in deep waters than in intermediate layers. Two sedimentary basins with possible hydrocarbon deposits are situated in these zones. In the Bellingshausen Sea area, the graphs of concentration versus depth don't show any special characteristic, either in surface water or in deeper layers. Since the presence of hydrocarbon deposits in this area is unlikely, it is concluded that a parallel exists between the high polynucleate hydrocarbon concentrations in surface and deep waters and the possible presence of sedimentary basins. (Auth. mod.)

Ventajas, L., **Diffusion difference between warm and cold waters** [Diferencia de difusión entre aguas cálidas y aguas frías], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1991 No.386, p.35-56, In Spanish with English, French and German summaries. 3 refs.

The study of vertical diffusion of polynucleate hydrocarbons, spilled by the bilge of the icebreaker *Almirante Irizar* in 3 Argentine ports and in the vicinity of 2 antarctic stations, is discussed. Analysis of curves of concentration versus time shows a variation at depths of 60-120 cm at all sites. However, in Antarctica no variations are observed during the first few hours, suggesting a slower diffusion of the hydrocarbons in colder water.

J-45188
Ventajas, L., **Polynucleate hydrocarbons in antarctic water and sediments** [Hidrocarburos polinucleados en sedimentos y en aguas antárticas], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1991 No.387, p.57-71, In Spanish with English, French and German summaries. 4 refs.

Samples of surface sediments from the sea floor in the vicinity of Marambio, Jubany and San Martín Stations were analyzed for polynucleate hydrocarbon contents. The highest concentrations of these compounds were found in the Marambio Station samples, both of sea water at various depths and of the bottom sediments. Concentrations are found to be comparable to those found in the contaminated offshore zones of arctic seas.

J-45189
Ventajas, L., **Polynucleate hydrocarbons in frozen and contaminated sea water and in antarctic waters at two different depths** [Hidrocarburos polinucleados en agua de mar congelada y contaminada y en aguas antárticas en dos profundidades], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1991 No.388, p.73-87, In Spanish with English, French and German summaries. 3 refs.

Containers with samples of sea water to which increasing quantities of petroleum were added were partly frozen, for equal periods of time and in vitro. It was found that the concentration of polynucleate hydrocarbons increased in water as well as in ice, suggesting that the diffusion phenomenon is enhanced by the polynucleate concentration. Samples of sea water to which equal quantities of petroleum were added were frozen in part for different periods of time and in vitro, showing the following: at first, the polynucleate hydrocarbon concentration in frozen water increases, remaining constant later because ice forms from surface water containing the suspended hydrocarbons. When these decrease enough, ice forms from the deeper water containing a minimum quantity of polynucleate hydrocarbons in solution. Analysis of sea water samples 0.5 m in depth showed higher concentration of hydrocarbons than that found in deeper water, which is attributed to the dense suspension of hydrocarbons in the air. (Auth. mod.)

Klinck, J.M., **Vorticity dynamics of seasonal variations of the Antarctic Circumpolar Current from a modeling study,** *Journal of physical oceanography,* Oct. 1991 21(10), p.1515-1533, 31 refs.

A one-layer numerical model was developed to analyze the vorticity dynamics of the seasonal variations of currents in the southern ocean. The model includes the continental geometry and bathymetry of the southern ocean and is forced by monthly climatological wind stress. Five cases are considered that compare circulation over a flat bottom to that with bathymetry, effects of zonally averaged wind stress forcing versus the climatological forcing, and anomaly wind stress versus the full stress. The individual terms in the vorticity conservation equation are calculated from the model solution along two latitude lines; 57.5S and 43.5S. In the zonal part of the flat bottom simulation, the curl of the surface stress balances bottom stress curl. However, in Drake Passage, *beta* balances bottom loss. Such vorticity interactions depend on the partial barrier of South America, and thus do not occur in zonal channel models. The removal of vorticity occurs throughout the southern ocean for the seasonally varying winds, but the mean circulation is balanced mainly by losses near

Drake Passage. The location of the Antarctic Circumpolar Current is controlled by the tip of South America rather than the structure of the wind. The seasonal changes in the model surface elevation in Drake Passage occur largely in the southern part of the passage, in agreement with pressure observations. Bottom topography changes the vorticity interactions so that the largest effects occur where the flow is forced over bathymetry, creating relative vorticity by stretching, which is then removed by bottom friction. (Auth. mod.)

Hellmer, H.H., Olbers, D.J., **On the thermohaline circulation beneath the Filchner-Ronne ice shelves,** *Antarctic science,* Dec. 1991 3(4), p.433-442, 26 refs.

The Weddell Sea oceanographic data and numerical models demonstrate that Ice Shelf Water, one ingredient in the production of Weddell Sea Bottom Water, is formed by thermohaline interaction of High Salinity Shelf Water with the base of the Filchner-Ronne ice shelves. South of Berkner I. a passage with a water column thickness of about 300 m linking the Filchner and the Ronne regimes is important for the ventilation of the sub-ice shelf cavities. To simulate the flow, a two-dimensional thermohaline circulation model was tested on several sections which approximate different geometries of a sub-ice shelf channel bounded by the ocean bottom and the ice shelf base. Temperature and salinity profiles measured in front of the Filchner-Ronne ice shelves are used to force the model. The results indicate that the circulation is sensitive to both salinity (density) forcing and depth of the shelf bottom prescribed at the open boundary representing the Ronne Ice Shelf edge. Where the shelf is shallow (400 m deep), a closed circulation cell within the Ronne cavity acts like an ice pump with accumulation rates of marine ice at the ice shelf base up to 1.5 m/y. The total outflow at the Ronne Ice Shelf edge is supported by an inflow from the Filchner regime. Where the shelf is deeper, a flow from the Ronne into the Filchner cavity develops if the bottom salinity at the Ronne Ice Shelf edge exceeds a critical value of 34.67. Seasonal variability imposed at both edges modifies the circulation pattern at the Filchner Ice Shelf edge such that the depth and magnitude of Ice Shelf Water outflow correspond with observations in the Filchner Depression. Voĭonov, G.N., Uranov, E.N., **Sea level tidal oscillations in the shelf area of Russkaya Station** [Prilivnye kolebaniia urovnia v shel’fovoĭ zone u stantsii Russkoĭ], *Sovetskaia antarkticheskaia ekspeditsiia. Trudy,* 1990 Vol.89, p.67-71, In Russian. 5 refs.

Prolonged measurements of sea level oscillations, obtained in the Ross Sea in 1985 and 1986, are discussed. Results of the harmonic analysis of monthly and bimonthly data, carried out by the Doodson method in the former, and the method of least squares in the latter, are presented. The hypothesis is advanced of the presence of amphidromic semi-diurnal M2 and S2 waves in the Cape Berks region.

Pochivalov, A.IU., Snopkov, V.G., **Heat storage in the active layer of the world ocean,** *Oceanology,* Feb. 1990 (Pub. Aug. 90) 30(1), p.18-24, 7 refs. For Russian original see 18J-42412.

Heat storage in the active layer (0-200 m) of the world ocean is estimated for each season using data from the Climatological Atlas of the World Ocean (NOAA). The contribution of each layer to the total heat storage, and its annual variation, are determined as follows: in all oceans, except the Indian Ocean, in the upper 50 m layer the maximum heat storage occurs in the fall; in the 150-200 m layer of the world ocean it occurs in winter. Results are presented on tables and maps. (Auth. mod.)

Hong, G.H., Kim, D.Y., Chung, H., Pae, S., **Coastal and inshore water interaction, mixing and primary productivity in the Bransfield Strait, Antarctica during austral summer 1989/90,** *Korean journal of polar research,* June 1991 2(1) (Special issue), Second International Symposium on Antarctic Science, Seoul, Korea, Sep. 17-18, 1990. [Proceedings], p.43-59, Refs. p.57-59.

Nutrients and chlorophyll *a* were collected along with CTD data in the Bransfield Strait proper and in Maxwell Bay during Dec. 29, 1989-Jan. 9, 1990. Inshore waters of Maxwell Bay and Marian Cove are diluted by the freshwater input provided by the nutrient-depleted glacial melting and surface runoff. Nutrients and organic matter appear to be imported from the Bransfield Strait to the inshore waters by tidal activity. Phytoplankton biomass (chl *s)* and water column stability (the surface mixed layer depth) were positively correlated in the southeast Pacific basin water mass. Results present clear evidence that phytoplankton growth in the Antarctic may be hindered by the water column instability, since the water column hydrography in the Bransfield Strait shows that the well-defined surface mixed layer is not fully developed but rather continuously stratified. This may partly explain the relatively poor productivity, despite high nutrient level, of the antarctic marine ecosystems. (Auth. mod.)

Hahn, S.D., **Meridional changes of sea surface temperature along 135E of the southern ocean,** *Korean journal of polar research,* June 1991 2(1) (Special issue), Second International Symposium on Antarctic Science, Seoul, Korea, Sep. 17-18, 1990. [Proceedings], p.189-192, 3 refs.

Based on monthly mean sea surface temperature (SST) observations during 7 years (1979-1985), the SST meridional effect was studied. Three variables were given as functions of southern latitude between 35S and 65S. They show linearly decreasing tendencies with increasing latitude. Decreasing rates per southern latitude, in degrees, are 0.11 C for annual SST range, 0.56 C for annual mean SST, and 2.8 kcal/sq cm/yr for radiation balance, respectively. (Auth.)

Kuvaas, B., Kristoffersen, Y., **Crary Fan: a trough-mouth fan on the Weddell Sea continental margin, Antarctica,** *Marine geology,* Apr. 1991 97(3/4), p.345-362, 39 refs.

Multichannel seismic investigations show the presence of a large trough-mouth fan deposit on the continental margin in the southern Weddell Sea. A characteristic feature of the fan is relatively few, but large canyons and/or channels which appear to have been stable for long periods. Levees associated with the channels may reach thicknesses of more than 1 km. Drilling during ODP Leg 113 recorded the presence of glaciers in East Antarctica since early Oligocene time, and the seismic stratigraphic evidence suggests that the submarine fan is largely composed of glacigenic sediments. The channel-levee systems and complexes indicate several growth phases, apparently controlled by glacial/interglacial climate fluctuations, with maximum fan growth during glacial periods. The present interglacial period is characterized by strong and erosive flow of Ice Shelf Water running down the western slope of the fan and carrying only minor amounts of suspended matter. The fan is essentially sediment starved during interglacial periods. The dimensions of the channel-levee complexes and the persistent loci of sediment supply suggest that turbidite sedimentation resulted from melting of wet-based glaciers at or near the shelf edge, which has consequently prograded 70-80 km seaward. (Auth.)

Grumbine, R.W., **Model of the formation of high-salinity shelf water on polar continental shelves,** *Journal of geophysical research,* Dec. 15, 1991 96(C12), p.22,049-22,062, 39 refs.

A model of the flow and salinity fields forced by sea surface salinity flux and wind stress curl is developed and used to examine the processes that create High-Salinity Shelf Water (HSSW). The flow field is the sum of the baroclinic geostrophic flow driven by salinity variations and a barotropic geostrophic flow driven by wind stress curl. The salinity field is controlled by advection, convection, and sea surface salinity flux associated with sea ice formation. The model domain represents the Weddell Sea or Ross Sea continental shelf without topography. Ekman pumping was seen to control the magnitude of the circulation, while the polynya freezing rate controlled the extent of salinization in the shelf water. The flux of HSSW is linear with respect to the polynya freezing rate. The modelled flux of HSSW and the flux of derived Bottom Water for present estimates of the forcings agree with the fluxes inferred from physical and chemical observations in the deep Weddell Sea by oceanographic field programs. The modelled flux of Bottom Water for the Ross Sea also agrees with observations. (Auth. mod.)

Jenkins, A., **One-dimensional model of ice shelf-ocean interaction,** *Journal of geophysical research,* Nov. 15, 1991 96(C11), p.20,671-20,677, 38 refs.

Large-scale oceanic circulation beneath antarctic ice shelves is driven by the thermohaline differences which result from mass and energy exchange at the ice-ocean interface. Dense saline waters are drawn underneath the ice shelves and emerge, cooled and diluted, as plumes of Ice Shelf Water. A simple one-dimensional model of this process has been developed, in which the Ice Shelf Water plume is treated as a turbulent gravity current, initiated at the inland margin by a flow of fresh meltwater emerging from beneath the grounded ice. Subsequent evolution of the plume as it ascends along an ice shelf base of specified geometry can be simulated. The model has been applied to a flow line on Ronne Ice Shelf to explain the observed distribution and rate of basal melting and freezing. Calculations indicate that the present mean melt rate of 0.6 m/y would increase to 2.6 m/y if the underlying water were to warm by 0.6 C. This would not only lead to significant thinning of the ice shelf but could also cause a profound change in ocean circulation on the open continental shelf. (Auth. mod.)

Lutjeharms, J.R.E., Webb, D.J., de Cuevas, B.A., **Applying the Fine Resolution Antarctic Model (FRAM) to the ocean circulation around southern Africa,** *South African journal of science,* Aug. 1991 87(8), p.346-349, 29 refs.

FRAM, the circulation model that lays claim to simulating the processes in the ocean with a verisimilitude to nature, is described. It is one of the largest and most detailed computer models of the ocean ever constructed. It covers the full ocean area south of 24S, and uses a grid with a resolution of 1/4 deg. in the north-south direction and 1/2 deg east-west. The model has 32 horizontal levels spaced at increasing intervals with depth, down to the deepest level of 5,500 m. The variables stored in the model are temperature, salinity and velocity. The topics being studied at present with the model include the physical processes controlling the Antarctic Circumpolar Current, the transport of potential vorticity, the heat transport of the southern ocean, the formation and transport of different water types by the Circumpolar Current, as well as the formation and influence of pack ice.

Lipski, M., Rakusa-Suszczewski, S., **Early summer pattern of vertical distribution of chlorophyll *a* (Bransfield Strait, Antarctica, November 1986),** *Polskie archiwum hydrobiologii,* 1990 (Publ. May 91) 37(3), p.287-293, 21 refs.

During Nov. 1986 chlorophyll *a* levels were determined at 17 oceanographic stations located in the Bransfield Strait. The results point to substantial concentrations of chlorophyll *a* below the euphotic zone, even at 400-500 m depths when the stability of the water column is very low. Chlorophyll *a* content calculated for the entire water column can be 8 times higher than the content in the euphotic zone.

Therefore, routine procedures for estimation of the standing crop of phytoplankton may lead to considerable underestimation. (Auth.)

Tréguer, P., **Production of biogenic silica in the Weddell-Scotia Seas measured with Si-32,** *Limnology and oceanography,* Sep. 1991 36(6), p.1217-1227, 16 refs.

During leg 2, Nov. 1988-Jan. 1989, of the European *Polarstern* study (EPOS) in the Weddell-Scotia Confluence zone, a new method was implemented based on Si-32, a *beta*-emitter in equilibrium with P-32, to determine biogenic silica (BSi) production. This method provides simultaneous determination of the production of organic P. Rates of BSi production ranged from 0.09 to 0.95 mmol Si/sq m/h, and the BSi content of the photic layer ranged from 7 to 220 mmol/sq m. The Si:C production molar ratios varied between 0.08 and 0.81, while the C:P production ratios varied between 47 and 151 with an average of 105, in agreement with the Redfield ratio. Given here is the first direct evidence that in the well-mixed waters of the Scotia Sea highly silicified diatom blooms may occur, and that unlike earlier descriptions, because of the intense grazing pressure of krill in the marginal ice zone (MIZ) of the Weddell Sea, the remaining siliceous phytoplankton can grow with only moderate Si production rates. It is concluded that the contribution of the MIZ to the total BSi production of the southern ocean must not be overstated. (Auth. mod.)

Wei, W.C., **Middle Eocene-lower Miocene calcareous nannofossil magnetobiochronology of ODP Holes 699A and 703A in the subantarctic South Atlantic,** *Marine micropaleontology,* Nov. 1991 18(1/2), p.143-165, 50 refs.

The distribution of calcareous nannofossils is documented for the middle Eocene through lowermost Miocene cores from Ocean Drilling Program Holes 699A and 703A in the subantarctic South Atlantic. The detailed nannofossil biostratigraphies established, in combination with published magnetostratigraphic data, have provided a fairly detailed age model for each hole. This study suggests that the middle Eocene through lowermost Miocene section from Hole 699A is virtually complete. A major hiatus has been identified in Hole 703A in the earliest Oligocene, coincident with an abrupt cooling in the southern ocean. Comparison of the nannofossil datum ages calibrated with magnetostratigraphy in the two holes with those from mid- and southern high latitudes demonstrates synchroneity or diachroneity for the following nannofossil datums which have last occurrence (LO) ages ranging from 26.8 Ma to 36.0 Ma and first occurrence (FO) ages ranging from 38.4 Ma to 39.0 Ma: LO *Reticulofenestra bisecta, Chiasmolithus altus, R. umbilica, Isthmolithus recurvus, R. oamaruensis;* FO *R. oamaruensis,* and *I. recurvus.* (Auth. mod.)

Jansen, E., **Deglaciation, impact on ocean circulation,** Encyclopedia of earth system science, Vol.2. Edited by W.A. Nierenberg, San Diego, Academic Press, 1991, p.35-46, 16 refs.

The climate system responds in a nonlinear fashion to the climatic forcing imposed by increased insolation during deglaciations. The ocean is an important factor for determining this response. To understand the way climate changed during these transitions, it is necessary to understand the role of the oceans,including Antarctic Bottom Water, as a mediator of both gradual and abrupt climate change. (Auth.-mod.)

Olson, D.B., **Ocean circulation,** Encyclopedia of earth system science, Vol.3. Edited by W.A. Nierenberg, San Diego, Academic Press, 1991, p.367-382 + 5 leaves, 5 refs.

Flows in the ocean at scales larger than 100 km make up vast patterns referred to as the ocean's circulation. The near-surface circulation is driven primarily by the wind and is divided into closed circulations known as gyres by the existence of continental boundaries. An exception to this is the Antarctic Circumpolar Current, which forms a flow around the globe at about 55S. In the deeper ocean there is a global pattern to the flow, with dense waters formed in the Atlantic Ocean and around Antarctica producing a relatively slow set of flows into the Indian Ocean and the Pacific Ocean. There is a return of surface waters back into the Atlantic to complete this thermohaline circulation. (Auth. mod.)

Botz, R., Bohrmann, G., **Low-temperature opal-CT precipitation in antarctic deep-sea sediments: evidence from oxygen isotopes,** *Earth and planetary science letters,* Dec. 1991 107(3/4), p.612-617, 30 refs.

Porcellanite has been found in antarctic deep-sea sediments of shallow burial depth at four different sites in host sediments younger than 4 Ma. Oxygen isotope analysis shows that the opal- CT samples are extremely rich in 18-O. According to the quartz/water fractionation the calculated isotopic opal-CT formation temperature is in the range of 0 to 4C. This agrees well with sediment temperature measurements. The low opal-CT precipitation temperature contrasts with current ideas about later diagenetic formation of opal-CT at higher temperatures of 18 to 56C (Auth.)

Foldvik, A., **Oceanographic research during NARE-84/85,** Filchner-Ronne Ice Shelf programme, Report 3 (1986), compiled by H. Kohnen, Bremerhaven, Alfred Wegener Institute for Polar and Marine Research, 1986, p.107-109.

DLC G890.F55R47

The physical oceanography work during NARE-1984/85 was a follow-up of previous work in the Weddell Sea. In particular the work was centered on further investigations of the flow of Ice Shelf water out of the Filchner Depression which was discovered during NARE-76/77. One year of currentmeter moorings showed that this flow of supercooled water most probably represents a major contribution to the process of bottom water formation: the volume leaving the shelf break is about 10 times the volume flux of the Amazon River. The temperature is below -1.9 C.

J-45537

Jacobs, S.S., **On the nature and significance of the Antarctic Slope Front,** *Marine chemistry,* Nov. 1991 35(1-4), p.9-24, 46 refs.

The region near the edge of the continental shelf around Antarctica is the primary site for renewal of antarctic surface waters and the deepest layers of the World Ocean. Here the Circumpolar Deep Water (CDW) reservoir approaches the sea surface and is transformed into a variety of surface, slope and shelf waters. It is the locus of enhanced exchange of heat, salt, gases and freshwater between the ocean, atmosphere, sea ice and glacial ice, and of nutrient and particulate material transport on and off the continental shelf. Rejuvenated near-surface waters here mix back into the deep ocean to modify the CDW and form Antarctic Bottom Water. The Antarctic Slope Front is a common oceanographic feature near the shelf break and has a major bearing on these processes. This topographically controlled front is marked by strong subsurface gradients in ocean temperature and chemistry, and by stronger alongshore currents than most of the adjacent continental shelf. It is one of the preferred routes for icebergs moving westward along the continental margin, and is characterized by regionally lower winter sea ice cover. There is significant evidence for regionally higher biological productivity along the Antarctic Slope Front. (Auth.)

Drewry, D.J., **Response of the antarctic ice sheet to climatic change,** Antarctica and global climatic change, edited by C.M. Harris and B. Stonehouse, London, Boca Raton, FL, Bellhaven Press, Lewis Publishers, 1991, p.90-106, 41 refs.

A central issue in sea level predictions is to determine better the sign and magnitude of antarctic ice volume changes and their timescales. In the short term the increase in precipitation over the ice sheet will be the principal response to a warming climate, and this effect is already observed. On the basis that the net accumulation over Antarctica is of the order of 2200 Gt/yr, a conservative increase in precipitation of 0.5% per year, as suggested from the Antarctic Peninsula and the results from East Antarctica, would lower sea level by approximately 0.03 mm/yr. Alternatively, the same lowering could be expressed as resulting from an average atmospheric temperature change over Antarctica of +2-3 C per decade. In the longer term, over the next 500 years or more, ice flow will adjust to enhanced ocean and atmospheric warming, with an increase in the discharge of ice stored on the continent to the sea. Initially this is predicted to occur through a thinning and retreat of ice shelves and ice streams, with possible consequent drawdown of ice in the interior of West Antarctica. Although rates are not known and available glaciological models are still primitive, some studies show that sea level rise could be of the order of 2 mm/yr once this process has been initiated.

Ou, H.W., **Some effects of a seamount on oceanic flows,** *Journal of physical oceanography,* Dec. 1991 21(12), p.1835-1845, 19 refs.

This paper demonstrates some effects of a seamount on oceanic flows through consideration of a uniform, two-layer flow passing a right circular cylinder of arbitrary height in a rotating fluid. In the case of vanishing stratification, previous results of low obstacles to an obstacle of finite height are first generalized, and employed to show how the frictional regime provides a transition from partial to total blocking as the obstacle top approaches the surface. In the case of general stratification, various dynamical regimes according to blockage of the flows, characterized by distinctive interface signatures were discerned. By generalizing the model results to a multiple-layer fluid, mesoscale features similar to those observed over the Emperor Seamounts have been deduced. When the model is applied to the Maude Rise in the Weddell Sea, it can explain the extensive ventilation of the water above the rise, with possible implications on the initiation and maintenance of the Weddell polynya. (Auth. mod.)

Charles, C.D., Fairbanks, R.G., **Evidence from southern ocean sediments for the effect of North Atlantic deep-water flux on climate,** *Nature,* Jan. 30, 1992 355(6359), p.416-419, 38 refs.

The southern ocean is perhaps the only region where fluctuations in the global influence of North Atlantic Deep Water (NADW) can be monitored unambiguously in single deep-sea cores. A carbon isotope record from benthic foraminifera in a southern ocean core reveals large and rapid changes in the flux of NADW during the last deglaciation, and an abrupt increase in the NADW production rate which immediately preceded large-scale melting of the Northern Hemisphere ice sheets. This sudden strengthening of the NADW thermohaline cell provides strong evidence for the importance of NADW in glacial-interglacial climate change. (Auth.)

Jamous, D., **Distribution of helium-3 in the deep western and southern Indian Ocean,** *Journal of geophysical research,* Feb. 15, 1992 97(C2), p.2243-2250, 37 refs.

New deep He-3 data from the INDIGO program give further insight into the distribution of this tracer in the Indian Ocean. This distribution exhibits some major features related both to a hydrothermal He-3 input in the Gulf of Aden and on the Mid-Indian Ocean Ridge and to the origin of the water masses and to the characteristics of the deep circulation. The main pattern is a significant north-south He-3 gradient, with deep waters of the southern ocean showing (delta) He-3 values around 8-9% due to the influence of the Atlantic deep waters poor in He-3, and relatively high values in the northern and central regions originating from the hydrothermal activity. In the easternmost part of the basin, the He-3 values exhibit a significant increase at shallower depths (around 1000 m) probably due to the Pacific water flow through the Indonesian sills, whereas the data in the Indian sector of the antarctic ocean show a maximum of the order of 10%, south of the Polar Current. These different aspects are summarized by mapping the horizontal distribution of the (delta) He-3 maxima all over the Indian basin. This map points out some characteristics of the deep circulation but also stresses the need for further measurements in order to clarify the description of this tracer in several key areas. (Auth. mod.)

Sept, V.V., **Autooscillations of the thermohaline circulation with asymmetric ocean distribution in northern and southern hemispheres,** *Akademiia nauk SSSR. Izvestiya. Atmospheric and oceanic physics,* Nov. 1990(Pub. June 91) 26(11), p.865-870, 5 refs. Translated from Akademiia nauk SSSR. Izvestiia. Fizika atmosfery i okeana.

The evolution of the thermohaline ocean circulation within the limits of a simple three-box model of the climatic ocean-atmosphere-glacier system is studied. When ocean distribution is asymmetric relative to the equator, the thermohaline circulation has four stable steady states. It is shown that solutions of the nonstationary equations contain autooscillations with a period of approximately 80 kyr, which causes a periodic change of the regimes of the thermohaline ocean circulation. Duration of the existence of separate circulation regimes, as well as their sequences, depend crucially on the relation of the areas of ocean and land in both hemispheres. (Auth.)

Duncombe Rae, C.M., **Physical and chemical marine environment of the Prince Edward Islands (southern ocean) during April/May 1987,** *South African journal of marine science,* 1989 Vol.8, p.301-311, With Afrikaans summary. 31 refs.

Physical (temperature, salinity), nutrient (silicate, phosphate, nitrate, nitrite) and chlorophyll-*a* data collected on a cruise to the Prince Edward Is. during Apr. and May 1987 are presented and discussed. Frontal features and distributions of surface nutrients suggest the presence of the Subantarctic Front at the islands. Further evidence for an anticyclonic eddy over the saddle between the islands is presented. Dilution of the surface mixed layer between the two islands in the group is shown to be the result of run-off from the islands, water which contributes to the nutrient structure of the circuminsular sea. Bölter, M., **Microbiological, planktonic and chemical characteristics and their validity for separation of water masses in the Bransfield Strait, Antarctica,** *South African journal of marine science,* 1987 Vol.5, The Benguela and comparable ecosystems, edited by A.I.L. Payne, J.A. Gulland, and K.H. Brink, p.133-143, With Afrikaans summary. 43 refs.

Oceanographic fronts have an important impact on biological systems in the marine environment, whether associated with coastal currents or upwelling systems. In this study, planktonic, microbiological and chemical parameters were investigated in antarctic waters in order to separate the water masses according to different patterns of biological parameters within the pelagic environment. Non-parametric statistical analysis of the data was used to demonstrate the biological or chemical structure apparently independent of the water masses as defined by conservative properties. This is considered to result mainly from the distribution of planktonic organisms and the behavior of particulate organic material during sedimentation, the latter seeming to be strongly affected by the degree of microbial degradation. It is suggested that the biological definition of water masses should consider the biological history of particular water masses in addition to oceanographic parameters, thereby yielding a better understanding of biological processes in relation to oceanographic fronts. Slip, D.J., **Accumulation of fishing debris, plastic litter, and other artefacts, on Heard and Macquarie Islands in the southern ocean,** *Environmental conservation,* Autumn 1991 18(3), p.249-254, 26 refs.

Sections of coastline of Heard and Macquarie Is. were surveyed for marine debris in the summer of 1987-88 and 1989, respectively. These surveys were carried out at the same sites as previous surveys in 1986-87 at Heard I., and in 1988 at Macquarie I. The minimum rate of artefact accumulation was 13 objects per km of shoreline per year for Heard I., and 90 objects per km of shoreline per year for Macquarie I. Drift-cards, released from known locations and collected on the two islands, show a similar artefact catchment area. Plastic litter was a major component of the debris at both islands. Fisheries-related debris accounted for 40% of all artefacts on Heard I., compared with 29% on Macquarie I. Entanglement of fur seals appears to be more common at Heard I., while plastic ingestion by seabirds appears to be more common at Macquarie I.

Hieke Merlin, O., **Geochemical characteristics of western Ross Sea (Antarctica) sediments,** *Marine geology,* July 1991 99(1-2), p.209-229, 40 refs.

A geochemical study of bottom sediments from 50 stations in various Ross Sea sedimentary environments, ranging from the coastal strip to the external platform, situated off southern Victoria Land between the David and Mariner glaciers, has demonstrated the silicate nature of these sediments and significant variations in the major element concentrations. A statistical analysis of the geochemical variables using the cluster method shows that Si is independent of the other elements, which group into associations. A multivariate statistical analysis based on geochemical, granulometric and environmental parameters identifies five distinct sediment groups located in different areas of sedimentation and with peculiar geochemical characteristics. These groups are identified and described. The materials are glacial-detrital, derived from the rocky hinterland formations, and are reworked by transport and deposition processes depending on the energy level of the marine sedimentary environments. Given the scarcity of comparison data from the hinterland rocks, it is difficult to establish the parent rocks of these glaciomarine sediments on the basis of geochemical data alone. Only in the case of the sediments south of Coulman I. can one be certain of a contribution from the McMurdo volcanics. For the external platform sediments, the highest contents of Si and L.O.I. confirm the input of material from biogenic neoformation. (Auth. mod.)

Chen, C.T.A., **Descriptive chemical oceanography of the Weddell Sea,** *Republic of China. National Science Council. Proceedings A,* Mar. 1991 15(2), p.133-142, 39 refs.

Concurrent CTD, salinity, O2, nutrients, pH, calcium, total alkalinity, total CO2 and pCO2 were obtained in the Weddell Sea in the late austral winter of 1981 as part of the Weddell Polynya Expedition aboard the Soviet icebreaker *Somov.* These data represent the initial concentrations of chemicals in the most important source region of world ocean bottom waters at the time they were formed. These winter Weddell Sea data were analyzed along with summer data reported in the literature, and the results indicate that: large variations in chemical concentrations occur across the Polar Front; pCO2 in the Weddell Sea surface water is only slightly lower than the atmospheric value; mixing dominates the distribution of chemical properties; pH, O2, total CO2 and pCO2 are useful in identifying the sources of waters in the Weddell Sea, whereas calcium and alkalinity are not; deep waters are not homogeneous but show discontinuities; and the upwelled Weddell Sea Deep Water makes up approximately 1/3 of the surface layer. Anderson, L.G., Jones, E.P., **Transport of CO2 into arctic and antarctic seas: similarities and differences in the driving processes,** *Journal of marine systems,* July 1991 2(1-2), p.81-95, 39 refs.

The transport of CO2 from the atmosphere to the surface water of the ocean is driven by the difference in partial pressure of CO2 at the air-sea interface. Since the atmospheric partial pressure of CO2 is nearly constant over periods of the order of exchange times, changing conditions of the surface of the ocean dominate the exchange process. In polar regions, the partial pressure of CO2 in the ocean is decreased mainly by two processes: a decrease in temperature and biological productivity. Both take place in the Arctic and Antarctic. In the Arctic, the vertical transport of cooled surface water by deep convection occurs mainly in the Greenland Sea and penetrates to a large depth, while in the Antarctic the deep convection does not primarily reach the same depths. Biological production is significant for the vertical transport of carbon in both the Arctic and Antarctic; however, in the Arctic the production is mainly over the large shelves, while in the Antarctic it takes place mostly over the deep ocean. In addition to cooling, surface water can also increase its density by salt addition from ice formation. When this happens over the shelves, high density shelf bottom waters are formed that might be enriched in total carbonate due to decay of organic matter at the sediment surface. These high density bottom waters flow towards the deep ocean, mixing with surrounding waters during transit and ending up at a matching density surface. This process seems to be quantitatively more important in the Arctic than in the Antarctic. Total alkalinity, total carbonate, calcium, oxygen, salinity and temperature data from several expeditions in the Arctic and the SWEDARP 88/89 expedition in the Antarctic are used in this discussion. Thomas, E., **Late Cretaceous-early Eocene mass extinctions in the deep sea,** *Geological Society of America. Special paper,* 1990 No.27, Global catastrophes in earth history; an interdisciplinary conference on impacts, volcanism, and mass mortality. Edited by V.L. Sharpton and P.D. Ward., p.481-495, Refs. p.493-495.

Upper Maastrichtian through lowermost Eocene deep-sea benthic foraminiferal records from Maud Rise (Weddell Sea) demonstrate that there was no mass extinction of these organisms at the end of the Cretaceous. In contrast, there was a global extinction of bathyal to abyssal benthic foraminifera at the end of the Paleocene, occurring in fewer than 25,000 yr at Maud Rise. Many benthic foraminiferal species that had originated during the Cretaceous became extinct, although there was no coeval mass extinction (of comparable importance) of terrestrial organisms and planktonic marine organisms. After this extinction the diversity of benthic faunas on Maud Rise was low for about 260,000 yr, and during the period of low diversity, the assemblages were dominated by species that may indicate the presence of abundant organic carbon, and possibly low concentrations of dissolved oxygen. The dominance suggests that the Paleocene/Eocene deep-sea benthic foraminiferal mass extinction was caused by a decrease in oxygen content of the waters bathing the lower bathyal reaches of the sea floor. Such a change could have been caused by a change in the circulation patterns of deep waters: these waters would become depleted in dissolved oxygen if there were a change from predominant formation of deep waters at high latitudes (cooling and sinking) to initiation of, or a strong increase of, formation at low latitudes (evaporation and sinking). (Auth. mod.)

Keir, R.S., Michel, R.L., Weiss, R.F., **Ocean mixing versus gas exchange in Antarctic Shelf waters near 150E,** *Deep-sea research,* Feb. 1992 39(2A), p.97-119, 42 refs.

In Feb. 1985, chlorofluoromethanes (CFMs), tritium and radiocarbon were measured in antarctic continental shelf waters near 150E. These distributions are used to evaluate (1) the transport of Warm Deep Water (WDW) and Antarctic Surface Water onto the shelf, and (2) the gas exchange rates across the sea surface. The time varying response of these tracers to atmospheric forcing is simulated with a box model of the water masses in this region. In the model, horizontal mixing of surface waters strongly affects the shelf radiocarbon level, but the CFMs and tritium are not affected. The observed low tritium concentrations (<0.2 TU) in the shelf waters provide a lower limit to the transport of tritium-deficient Warm Deep Water into the region, which is equivalent to a vertical flux of about 75 m/y. This implies a maximum residence time of WDW in the basin of about 8 years. The transport of subsurface water out of the basin at the shelf break is estimated to be approximately 200,000-400,000 cu m/s. The average annual CFM piston velocity for gas exchange is estimated to be about 200 m/y. (Auth.)

Bersch, M., Becker, G.A., Frey, H., Koltermann, K.P., **Topographic effects of the Maud Rise on the stratification and circulation of the Weddell Gyre,** *Deep-sea research,* Feb. 1992 39(2A), p.303-331, 17 refs.

Hydrographic data indicate that due to the Maud Rise the upwelling of relatively warm and more saline Lower Circumpolar Deep Water (LCDW) in the Weddell Gyre and the entrainment of LCDW into the upper layer are enhanced, which increases the ocean heat loss and enriches the salinity of the upper layer. By these processes the water column is preconditioned for deep convection. An anomalous water column with a diameter of about 150-200 km, notable for its relatively cold deep water and its relatively saline upper layer, is situated above the crest of the Maud Rise. Water from its main pycnocline spreads laterally within the upper 500 m and compensates for the entrainment of LCDW into the upper layer. Current meter data from the Winter Sea Project 1986 show a marked temporal and spatial variability of the southward transport of LCDW in the lee of the Maud Rise. An anticyclone of LCDW, which had cut off from the main body of LCDW east of the Maud Rise, migrated southward along the western slope with a velocity of about 3 cm/s. It was followed by a cyclone, which had probably formed at the front of the anomaly due to a strengthened flow, undergoing an enhanced meandering. The wavelength of the entire disturbance is estimated to be about 380 km, one-third of the circumference of the Maud Rise anomaly. If the disturbance repeats continuously, about two to three anticyclones detach per year. (Auth.)

J-45933

Charles, C.D., **Biogenic opal in southern ocean sediments over the last 450,000 years: implications for surface water chemistry and circulation,** *Paleoceanography,* Dec. 1991 6(6), p.697-728, Refs. p.727-728.

Records are presented of biogenic opal percentage and burial rate in 12 piston cores from the Atlantic and Indian sectors of the southern ocean. These records provide a detailed quantitative description of changing patterns of opal deposition over the last 450 kyr. The striking regional coherence of these records suggests that dissolution in the deep sea and sediment pore waters does not obscure the surface productivity signal, and therefore these opal time series can be used in combination with other surface water tracers to make inferences about the chemistry and circulation of the southern ocean under different global climate conditions. Three broad depositional patterns can be distinguished. Taken as a whole, the opal records show no evidence for the increased total antarctic productivity predicted by recent geochemical models of atmospheric CO2 variability. (Auth. mod.)

Veth, C., **Evolution of the upper water layer in the marginal ice zone, austral spring 1988, Scotia-Weddell Sea,** *Journal of marine systems,* Aug. 1991 2(3-4), p.451-464, 25 refs.

In this paper, a one-dimensional turbulent erosion model is presented to study the temporal behavior of the upper layers of the water column in the marginal ice zone during ice retreat. Input parameters in the model are the regular meteorological observations on board, global radiation and ice cover estimates. The model results are validated by comparison with CTD profiles measured during repeated sections through the marginal ice zone of the Weddell-Scotia Sea sector of the southern ocean over a six week-period in the austral spring, 1988. Grebmeier, J.M., Barry, J.P., **Influence of oceanographic processes on pelagic- benthic coupling in polar regions: a benthic perspective,** *Journal of marine systems,* Aug. 1991 2(3-4), p.495-518, Refs. p.514-518.

A major difference between the Antarctic and Arctic is that the nearshore deep Antarctic is characterized by relatively high benthic abundance and biomass despite low water column production, suggesting that stability, low disturbance levels and cold temperatures enable benthic organisms to grow larger than in the Arctic. Both physical and biological disturbance levels are high in the marginal seas of the Arctic and may directly influence benthic productivity. The relationship between primary production and sedimentation of organic material to the benthos is nonlinear due to its dependence on the role of the pelagic food web. This review discusses the pelagic system with respect to how it impacts the net food supply reaching the benthos. A major objective is to demonstrate the influence of oceanographic processes on pelagic-benthic coupling in polar regions from a "bottom-up" perspective, using benthic studies from various regions in both the Arctic and Antarctic. Similarities and differences in oceanographic processes, benthic abundance and biomass, and benthic carbon cycling within these polar marine systems are discussed and areas for further research identified. Gordon, A.L., **Southern ocean: its involvement in global change,** International Conference on the Role of the Polar Regions in Global Change, Fairbanks, June 11-15, 1990. Proceedings, Vol.1, Fairbanks, University of Alaska, Dec. 1991, p.249-255, 35 refs.

Within the seasonal sea ice zone and along the margins of Antarctica, convection injects very cold oxygenated water into the deep and bottom ocean. These conditions developed as Antarctica shifted into its present configuration and grew a persistent glacial ice sheet, about 14 m.y.a. The potential of the southern ocean to ventilate the deep and bottom ocean layers is related to occurrence of polynyas that form within the winter sea ice cover. Global climate changes would be expected to alter the polynya size and frequency. Under greenhouse-induced warming, offshore polynyas may become less common as the static stability of the southern ocean mixed layer increases. This would diminish the southern ocean's cooling influence on the deep layers of the world ocean, resulting in a warmer deep ocean. The fate of coastal polynyas is less clear. It is likely that they would continue at close to their present form, providing a setting conducive to Antarctic Bottom Water formation. Within the polar front zone, global warming is expected to create lower salinity though slightly cooler surface water. A reduction in the salt input to the Antarctic Intermediate Water would inject it into a shallower horizon at the thermocline base, further limiting the thickness of the thermocline. (Auth. mod.)

Simmonds, I., Budd, W.F., **Model studies of the effects of global warming and antarctic sea ice changes on antarctic and global climates,** International Conference on the Role of the Polar Regions in Global Change, Fairbanks, June 11-15, 1990. Proceedings, Vol.1, Fairbanks, University of Alaska, Dec. 1991, p.256-262, 18 refs.

Results are discussed obtained in 3 experiments of changing the global ocean temperatures and the concentration and distribution of antarctic sea ice in a General Circulation Model of July climate. The object was to determine the local and global impacts of antarctic sea ice variations alone, as distinct from those coupled with global scale temperature changes which may be associated with global warming. In all cases there were significant changes in the upward flux of sensible heat over the sea ice zone associated with the reductions of sea ice. The response of weaker westerlies between 40 and 65S was common to all 3 experiments. Analyses suggest that a significant proportion of this is a response to the change in sea ice concentration alone. It is suggested that when consideration is given to the possible impact of feedbacks not considered in these experiments, sea ice changes alone, and particularly those in the Southern Hemisphere, have the potential to induce changes on a hemispheric scale. Nelson, D.M., Gordon, L.I., **Distributions of biogenic silica and dissolved silicic acid in the surface waters of the Ross Sea, Jan. and Feb. 1990,** *Antarctic journal of the United States,* 1990 25(5), p.98-100, 10 refs.

The east-west distributions of dissolved and particulate silica in the western Ross Sea in the summer of 1990 were very similar to those observed in the same region in the summer of 1983: there is clear evidence that an ice-edge diatom bloom had produced exceptionally high (>25 micromoles/l) biogenic silica levels in the surface water with corresponding depletion of dissolved silicic acid. The 1990 transect, however, extended considerably further east than any that had been occupied before and showed 2 other regions of biogenic silica accumulation (more than 8 micromoles/l) and silicic acid depletion to the east. Unlike the diatom bloom to the west, these eastern features had a more mixed algal assemblage. It is concluded that the annual mass balances of both biogenic silica and organic carbon in the water column of the Ross Sea are likely to be considered more complex, and the spatially integrated production rates higher, than preliminary mass balances based largely on 1983 data.

Barry, J.P., Dayton, P.K., Dunbar, R., Leventer-Reed, A.R., **Winter oceanographic observations in McMurdo Sound, Antarctica,** *Antarctic journal of the United States,* 1990 25(5), p.106-107, 2 refs.

To measure ocean currents in McMurdo Sound, a current-meter was deployed during Jan., and recovered in Nov., of 1989. The current pattern differed considerably at 2 sampling depths. Flow near the bottom (570 m) was nearly always toward the south along the main axis of the sound, with a net speed of 3.6 cm/s. The average current speed, irrespective of direction, was 6.7 cm/s. In contrast, the shallow meter (180 m) indicated that currents were much more variable in speed and direction, with a net flow toward the northeast at 2.1 cm/s. The mean adirectional speed was slightly lower at 180 m (6.0 cm/s) than at 570 m. These observations suggest that there are seasonal or interannual changes in the flow pattern in the upper water column or there is a countercurrent flowing toward the northeast near 170 m, or both. The salinity and temperature data indicate dramatic seasonal and shorter-period shifts in these two parameters. In addition, the temperature and salinity are strongly inversely related to one another, indicating that changes in salinity are related to the addition of warmer meltwater from sea ice or glacial ice, or both.

Michel, R.L., Schroeder, R.A., **Stable isotope results, Wilkes Land Oceanographic Expedition, 1985,** *Antarctic journal of the United States,* 1990 25(5), p.107-109, 5 refs.

During Feb. 1985, an oceanographic investigation was carried out along the antarctic shelf break from 145E to 160E. Physical, chemical and biological data were collected to study the water masses in the region and their interaction, including the distribution of deuterium and oxygen-18. The results of the seawater analyses are given in a table, along with temperature, salinity, density, and oxygen data at the same depths. Data show that isotopic differences between water masses are near the analytical uncertainty, although there is some indication that the Warm Deep Water is slightly more positive and that the very cold shelf bottom waters are slightly more negative. Samples of pack ice also were collected by coring an ice floe on the shelf. This ice floe was approximately 4 m thick at the center, and stable isotopic compositions were determined from four depths. During the freezing process, a marked isotopic fractionation occurs with the ice becoming enriched in the heavy isotope.

Gordon, A.L., Huber, B.A., **Winter Weddell Gyre Study, 1989: physical oceanography on board *Akademik Fedorov*,** *Antarctic journal of the United States,* 1990 25(5), p.110-113, 3 refs.

As part of a continuing international effort, science teams on board the icebreaking research vessels *Akademik Fedorov* and *Polarstern* carried out austral winter research in the Weddell Gyre in 1989. A cluster of closely spaced conductivity-temperature-depth stations including a 1-week time series was obtained at a site west of Maud Rise, where summer-period data reveal the frequent presence of a large pool of warm deep water with associated high oceanic heat flux, the effects of which are evident in the sea-ice characteristics and from atmospheric boundary layer measurements. The combined *Fedorov-Polarstern* data provide a nearly synoptic view of the east-west spatial variability across the winter Weddell Gyre, including the gyre inflow in the east, the western boundary current, the central hub of the gyre, the downstream region from Maud Rise with the expected thermohaline perturbations, and across the northern boundary of the gyre in the Scotia Sea region.

J-46003
Gordon, L.I., Jennings, J.C., Jr., **Winter Weddell Gyre Study 1989: nutrient, oxygen, and biomass chemistry on board F.S. *Polarstern*,** *Antarctic journal of the United States,* 1990 25(5), p.113-115, 4 refs.

The chemistry program of WWGS 89 was designed to provide an accurate, precise set of chemical data in order to quantify the Weddell Gyre circulation and the heat, salt, and chemical transports related to it at the end of the winter season. The surface mixed layer was found to be nearly homogeneous vertically in oxygen and nutrient concentrations. Dissolved oxygen was undersaturated below the pack ice, but no clear trend of increasing or decreasing undersaturation with location was seen along the main transect from the Antarctic Peninsula to Cape Norvegia. In the shallow sections the main body of the Weddell Gyre is easily distinguished from the outflowing western boundary current in the northwest and the inflowing coastal current in the southeast. Each terminus of the transect was characterized by very deep mixed layers, and only in the central gyre were there significant accumulations of nitrite and ammonium. The analyses of nutrient concentrations in ice core subsamples revealed considerable variability. Ammonium concentrations were usually much higher than in the underlying surface waters, and often higher than any normal seawater ammonium levels. Phosphate exhibited greater variability than did the other nutrients. There did not appear to be a strong correlation of nutrient concentration with ice structure or texture.

Amos, A.F., Jacobs, S.S., Hu, J.H., **RACER: hydrography of the surface waters during the spring bloom in the Gerlache Strait,** *Antarctic journal of the United States,* 1990 25(5), p.131-134, 7 refs.

This study of the hydrography of the upper waters of the Gerlache Strait was done as part of the RACER (Research on Antarctic Coastal Ecosystems and Rates) study. The goal was to aid in answering two questions posed by the RACER investigators: namely, what physical mechanisms account for the productivity of the Gerlache Strait, and what role does mass-transport play in determining biomass gradients there. Four series of replicate conductivity-temperature-depth (CTD) stations to 500 m were made at the RACER grid locations within a period of 26 days. The time-series relationship of waters in the RACER area in Nov. 1990 shows the influence of four distinct water masses. They are a fresh surface layer which warms to above 1 C as the month progresses, a colder subsurface layer around 34 per mill, probably a remnant of "Winter Water," a high-salinity warm water (>34.6 per mill) found below 300 m in the Bransfield, and a cold (<0 C), saline (>34.5 per mill) water found at the bottom. Within the Gerlache Strait, specifically at time-series station A, there is evidence of each of these masses influencing the water column, as indicated by the shape of the time-series curve, shown in a figure.

Niiler, P., Illeman, J., Hu, J.H., **RACER: Lagrangian drifter observations of surface circulation in the Gerlache and Bransfield Straits,** *Antarctic journal of the United States,* 1990 25(5), p.134-137, 1 ref.

A new family of Argos satellite-tracked near surface drifters, called TRISTARs, which have the capability of following water particles of a few meters' horizontal and vertical scale in the upper ocean with an accuracy of 1 cm/s or 1 km/d, are described. In Gerlache and Bransfield Straits, 18 drifters were deployed and, in the ice-filled sea, 12 of them survived long enough to provide the data set, part of which is displayed in a figure. The Lagrangian technique is found to be a very powerful tool in rendering an insightful view of circulation patterns, especially in areas where no measurements have ever been done before, because both temporal and spatial scales are revealed in real time. This study shows that there are many new patterns to be discerned in antarctic waters. The complex circulation patterns in the Gerlache Strait and the immediate vicinity of its merging with the Bransfield Strait are shown in a figure.

Shirodkar, P.V., Goes, J.I., Alagarsamy, R., Fondekar, S.P., **Major elements, nutrients, and plankton biomass in the ice edge and an offshore region of the Indian Ocean sector of the southern ocean,** *Polar record,* Apr. 1992 28(165), p.127-136, 28 refs.

Physico-chemical and biological studies during summer of 1986-1987 in the ice-edge and a region offshore of Antarctica indicated significant spatial differences in concentrations of nutrients, dissolved oxygen (DO), Ca, Mg, and chlorophyll *a,* and in the rates of primary production. The waters within the ice-edge region were richer in nutrients and DO and showed a four-fold increase in chlorophyll *a* and a 10- fold increase in primary productivity as compared with offshore waters. In the ice-edge region, Mg was high, whereas values of Ca were within the normal range. Offshore Ca and Mg were within the expected limits. Nutrients in the ice-edge region showed increasing concentrations at deeper levels, irrespective of their relationship with DO, indicating large amounts of preformed nutrients, a characteristic of antarctic waters attributable to intense upwelling. Chlorophyll *a* showed a direct relation with primary productivity and an inverse relation with Mg, suggesting the release of Mg from biogenic matter. Offshore, phosphate-phosphorus (PO4-P) was significantly correlated with nitrate-nitrogen (NO3-N) and inversely correlated with primary productivity and chlorophyll *a,* indicating the utilization of PO4-P during high production. Significantly elevated concentrations of chlorophyll *a,* primary productivity and Mg, marked by a considerable decrease in nutrients, were observed at a frontal zone between 64 and 62S. (Auth. mod.)

Goeyens, L., **Spatiotemporal variability of inorganic nitrogen stocks and uptake fluxes in the Scotia-Weddell Confluence area during November and December 1988,** *Marine ecology progress series,* Oct. 1991 77(1), p.7-19, 48 refs.

Distributions of nitrate and ammonium and corresponding uptake fluxes were investigated in the Scotia- Weddell Confluence area during EPOS LEG 2 (Nov. and Dec. 1988) on board RV *Polarstern.* In this area a central low-salinity and low-nitrate compartment extends southward from the Scotia Front over 1 to 1.5 deg. latitude. High ammonium concentrations and marked nitrate depletions indicate an enhanced biological activity in this part of the ocean. By means of the uptake rates obtained from N-15 incubations, and of nitrate depletion data, it is proved that this marginal ice zone ecosystem shifts from predominantly new production based (highest f-ratio 0.83) to regenerated production based (lowest f-ratio 0.30) after some 3 wk. This transition corresponds with the change from a higher diatom presence to a higher flagellate presence in the phytoplankton community. Moreover, it is in agreement with the described sudden termination of export fluxes in the Weddell Sea. (Auth.)

For individual papers see B-46150, B-46168, E-46151, E-46154, E-46157, E-46158, E-46161, E-46164, F-46148, I-46155, I-46159, I-46167, I-46170, J-46145 through J-46147, J-46149, J-46152, J-46153, J-46156, J-46160, J-46162, J-46163, J-46165, J-46166 and J-46169 or 46-3529 through 46-3536.

This volume presents reprints from Vol. 81, Nos. 7-8 and 9-10, of the Annali di chimica, published by the Italian Chemical Society in Rome, 1991. Both issues contain reports from research units of various Italian expeditions to Antarctica between 1987 and 1989. The research projects focused on the chemical composition of the atmosphere, as well as terrestrial and marine environments (sea water, sediments, suspended matter, ice, fish, fresh water, snow, aerosols) and on the human factor resulting from activities at the Terra Nova Bay Station.

Capodaglio, G., Scarponi, G., Toscano, G., Cescon, P., **Cadmium complexation in surface seawater of Terra Nova Bay (Antarctica),** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.279-296, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 28 refs. For another version of this article see 19J-44318.

Cadmium complexation in the surface water of Terra Nova Bay, collected during the 3rd (1987-88) and 4th (1988-89) Italian expeditions, was studied by Differential Pulse Anodic Stripping Voltammetry (DPASV). Total dissolved cadmium concentration ranged between 0.08 and 0.69 nM. Temporal variations in sea conditions, occurring during the summer, are likely to be responsible for most of the high variability of data. Considerable differences in the Cd content were observed between samples collected under the pack and those taken after the sea ice had melted. A possible explanation is given. The inorganic or ASV-labile fraction of the metal was 21-75%. Data obtained were consistent with one class of organic ligands whose concentration varied between 0.12 and 2.10 nM. The mean value for the logarithm of the conditional stability constant was 9.5. (Auth.)

Papoff, P., Betti, M., Onor, M., Giovannoni, G., **Individual spread of concentrations of alkali and alkaline-earth elements in sea water samples from Terra Nova Bay—Ross Sea (Antarctica). 2,** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.297-315, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 9 refs. For part 1 of this article see 19J-44316.

Results from the determination of alkali and alkaline-earth elements in filtered and acidified sea water samples from Terra Nova Bay (1987-88 and the 1988-89 expeditions) are presented. The average concentration values between stations ranged in the interval 390-460, 5.1-8.0, 46-59, and 6.4-15.0 macro-M for sodium, potassium, magnesium and calcium respectively; and 14-30 micro-M for lithium. Relative standard deviations lower than 1% were usually observed for all the elements whatever their concentration levels in the solution injected into the chromatographic column, with the exception of lithium (2%). The degree of representativity of the samples with respect to the real system around each sampling station was estimated for all the elements. Individual fluctuations in the concentration of the elements, due to external events, are highlighted. (Auth.)

Saini, G., Baiocchi, C., Giacosa, D., Roggero, M.A., **Determination of some heavy metals in snow and sea water at Terra Nova Bay (Antarctica),** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.317-324, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 16 refs.

Samples of seawater and of snow collected by the Italian expedition to Antarctica in 1988-89 in the area of the Terra Nova Bay Station and in the Ross Sea have been analyzed for Cu, Ni, Cd, Cr and Mn. Preconcentration of seawater samples has been made by reductive precipitation, while snow samples have been lyophilized. The determinations were made by GFAAS with Zeeman background correction. The results, showing highest concentrations of the elements in the vicinity of the Station, are discussed. (Auth.)

Mentasti, E., Porta, V., Abollino, O., Sarzanini, C., **Metal trace determination in seawater samples from Antarctica. 2,** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.343-355, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 9 refs. For part 1 of this article see 19J-44320.

A series of metal ion traces in the water of the Ross Sea were determined using ICP atomic emission spectroscopy. In order to obtain the sensitivity required, enrichment procedures based on precomplexation/adsorption on a minicolumn have been optimized and adopted. Such procedures allow a closed-loop on-line treatment of the sample which ensures very limited alteration of the sample. For the retention of metal traces, 8-hydroxyquinoline (8-Oxine) or 1-(2-thiazolylazo)-2-naphthol (TAN) were used in conjunction with Amberlite XAD-2 resin. Precision, accuracy, blanks and detection limits of the optimized procedures are discussed. (Auth.)

Fuoco, R., Colombini, M.P., Abete, C., **Evaluation of pack melting effect on polychlorobiphenyl content in sea water samples from Terra Nova Bay, Ross Sea (Antarctica),** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.383-394, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 11 refs.

The total contents of PCB in sea water samples collected in Terra Nova Bay during the Italian expedition of 1988-1989 are reported along with individual PCB isomer concentrations. Liquid-liquid extraction with n-hexane was found to be more reproducible than solid-liquid extraction. Clean-up of extracts was effected on a Florisil column which in experimental conditions eliminates interferences due to other chlorinated pesticides. PCB determination and identification were performed by high resolution gas-chromatography (HRGC) and HRGC/FT-IR spectrometry respectively. The results obtained showed for the area under study a typical value of 0.6 ng/l as total PCB concentration and a temporary local increase up to 1.7 ng/l which may be due to pack melting. Distribution among congener classes showed a chlorination level similar to that observed for oceanic waters and centering on three to penta substituted isomers. (Auth.)

Desideri, P., Lepri, L., Checchini, L., **Organic compounds in sea water and pack ice in Terra Nova Bay (Antarctica),** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.395-416, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 5 refs.

Sea water and pack ice samples taken from Terra Nova Bay during the 1988/89 4th Italian expedition to Antarctica were analyzed by using High Resolution Gas Chromatography (HRGC) and GC-MS. Several biogenic and anthropogenic organic compounds were identified in the two matrices. Some classes of organic compounds were more prevalent in pack ice than in the sea water under the pack, and in the sea water taken at the surface during the natural melting process of the pack. The results were compared with those obtained from the sea water samples taken during the previous expedition (1987/88). (Auth.)

Loglio, G., **Air-sea exchange in antarctic environment and snow microcomponents,** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.453-467, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 12 refs.

The process of the air-sea exchange of matter was studied in Terra Nova Bay seawater with the aim of characterizing the antarctic marine environment. The samples were collected during the expeditions of 1988-1989 and 1989-1990. The presence of surfactant and fluorescent materials is evidenced in the snow. On the basis of laboratory experiments, a photochemical effect on these components is suggested for high-altitude snow depositions. Laboratory investigations on the formation of sea-water aerosol appear useful for a better understanding of natural aerosol transport. (Auth.)

Morselli, L., Zappoli, S., Donati, A., **Evaluation of the occurrence of PCBs in Terra Nova Bay, Ross sea. Results of the second campaign,** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.503-510, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 10 refs.

The results of the determination of polychlorobiphenyls (PCBs) in sea water and samples of soil collected in Terra Nova Bay during the second Italian scientific campaign in winter 1988/89 are presented. Trace concentrations of PCBs were detected in all the samples analyzed. From the diffusion of PCB contamination and the samples' chromatographic profile, it can be assumed that PCBs are transported to the Antarctic by means of a long-range mechanism. Details on sample treatment are given. (Auth.)

Desideri, P., Lepri, L., Santianni, D., Checchini, L., **Chlorinated pesticides in sea water and pack ice in Terra Nova Bay (Antarctica),** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.533-540, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 22 refs.

Sea water, pack and particulate samples collected around the Italian research station in Antarctica and the adjacent Terra Nova Bay from Dec. 1988 to Feb. 1989 were analyzed for the presence of chlorinated pesticides; HCHs, DDTs, aldrin, dieldrin and heptachlor were found. The concentrations of HCH isomers (alfa-HCH and lindane) were nearly the same as those reported by Tanabe *et al.* in different areas of Antarctica in the period Dec. 1980-Mar. 1982. (Auth.)

J-46165
Triulzi, C., **Presence of radionuclides in biotic and abiotic matrixes collected in the environment around the Italian Base in Antarctica,** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.549-561, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 11 refs.

Results obtained from analyses of both natural and artificial radioactivity contained in samples collected in the inlet surrounding the Italian base and in Terra Nova Bay during the 1988-89 and 1989-90 expeditions, are presented in this paper. The data were obtained from marine water, organisms and sediment; lacustrine water, vegetable and sediment; and soil, mosses and lichens sampled at different stations. Tabulated results on K-40, Cs-137, Th-232 and U-238 are given. Caesium isotopes are compared with data obtained from similar material collected in the Northern Hemisphere. (Auth.)

Cremisini, C., Orlandi, C., Torcini, S., **Major, minor and trace elements in the surface waters at Terra Nova Bay (Antarctica). Data collected during the 2nd, 3rd and 4th Italian expeditions (1986-1989),** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.563-577, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 22 refs.

Concentrations of major, minor and trace elements are reported for 60 samples of meltwaters, streams and small lakes taken at 28 different sites in Terra Nova Bay. The chemical composition of the waters analyzed is clearly affected by salt of marine origin, the influence of sea spray being evident; sodium and chlorine are the dominant ions while rock weathering is a subordinate source of chemicals. Trace element levels do not exhibit anomalous values. (Auth.)

Desideri, P., Lepri, L., Checchini, L., **Identification and determination of organic compounds in antarctic sediments,** Antarctica Project. Environmental impact: chemical methodologies, [Rome, Italian Research Council, 1991], p.595-603, Reprinted from Annali di chimica, 1991, Vol.81(7-8 and 9-10). 3 refs.

Sediment samples taken from the Terra Nova Bay Station and the Ross Sea during the 3rd Italian expedition (1987/88) have been analyzed for the presence of natural and anthropogenic organic compounds. Linear and branched aliphatic hydrocarbons, alkyl derivatives of benzene, polycyclic hydrocarbons and heterocompounds such as phthalates, amides, alcohols, benzotiophenes, have been identified. The distribution and concentration of biogenic and anthropogenic compounds in the sediments, and the distribution ratio between sediments and sea water of some phthalates, are reported. (Auth.)

Odamaki, M., **Mean sea level observed at Syowa Station, East Antarctica,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1991, p.20-28, 7 refs.

Continued tidal observation have been carried out at Showa Station as part of the Japanese Antarctic Research Expedition project since 1966. The tidal observation system and data processing manner are described in this paper. Using the well-controlled data from 1981 to 1987, monthly mean sea-levels are analyzed and show a trend of falling at about 1 cm/yr. It is also shown that seasonal changes of mean sea-level at Showa Station are greater than those at other stations on the antarctic ocean. (Auth. mod.)

Tréguer, P., ed, Quéguiner, B., ed, **Biochemistry and circulation of water masses in the southern ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, 623p., Proceedings of a symposium, July 1990, Brest, France. For individual papers see B-46225 through B-46234, B-46240 through B-46242, J-45537, J-46209 through J-46224, J-46235 through J-46239 and J-46243 through J-46250.

The antarctic ocean represents the greatest area of nutrient-rich seawater on the earth. However, this region is now thought to be much less photosynthetically productive than was believed 10 years ago, and the major part of the antarctic ocean is one of the less productive marine ecosystems (processes limiting primary production are still a matter of debate). Pelagic autotrophic production does however support large biomasses at higher trophic levels. As studies become more numerous, and with the increased use of new facilities (sediment traps, satellite imagery, ice-breaking research vessels and submarine sensors), it becomes clear that the southern ocean is a complex mosaic of subsystems (open ocean areas, marginal ice zone, sea-ice zone and coastal and island systems). Large seasonal, annual and interannual variability of material fluxes in the pelagic ecosystems is indicated by recent studies. Little is known about the cycling of biogenic material at the sediment-water interface and through the benthic ecosystems, which do not appear to be as impoverished as previously expected. Specific aspects of these topics related to the biogeochemistry and circulation of water masses were presented and discussed during the July, 1990 International Symposium in Brest, France, including 120 scientists originating from 17 countries.

Nowlin, W.D., Jr., **On water mass exchange between the southern ocean and the World Ocean; emphasis on the Atlantic sector,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.1-7, 32 refs.

Reviewed here are the principal mechanisms for water mass exchange between the southern ocean and the remaining World Ocean: wind stress acting on the southern ocean drives the eastward-flowing Antarctic Circumpolar Current (ACC). Deep convection occurring south of the ACC, within or on the edges of the cyclonic subpolar gyres, renews bottom and deep waters. Exchange of water occurs at all depths across the deep-reaching zonal fronts of the ACC. (Auth. mod.)

J-46210
Fahrbach, E., Knoche, M., Rohardt, G., **Estimate of water mass transformation in the southern Weddell Sea,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner., p.25-44, 37 refs.

Weddell Sea Bottom Water recirculates in the west. By comparing the in- and outflowing water masses, transformation rates are estimated on the basis of a data set obtained during the Winter Weddell Gyre Study from Sep. to Oct. 1989. This consisted of a salinity-temperature-depth (CTD) section carried out by R/V *Polarstern* from the northern tip of the Antarctic Peninsula to Cape Norvegia, and data from three current meter moorings maintained from 1989 to 1990 in the eastern boundary current off Cape Norvegia. At the mooring site barotropic currents were measured. They were extrapolated to the interior under the assumption that wind-driven, baroclinic and barotropic current fields are of similar shape. The location of the gyre center was determined from drifting buoy tracks and geopotential anomaly. A linear current profile from the eastern boundary current to the center of the gyre was assumed, and the western outflow was determined according to mass conservation. The total mass transport was split into individual water masses. Differences between inflow and outflow result in a transformation rate of 3-4 Sv from Winter and Warm Deep Water to Antarctic and Weddell Sea Bottom Water. The net heat and salt transport across the transect implies heat fluxes from the ocean to the atmosphere of 3-10 W/sq m and ice formation rates of 0.2-0.35 m/yr. (Auth. mod.)

Park, Y.H., Gambéroni, L., Charriaud, E., **Frontal structure and transport of the Antarctic Circumpolar Current in the south Indian Ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.45-62, 25 refs.

The frontal structure and volume transport of the Antarctic Circumpolar Current (ACC) in the south Indian Ocean sector are described. Recent findings on sea-level variability from GEOSAT altimeter data are reviewed as well as barotropic transport variability from bottom pressure measurements at Kerguelen and Amsterdam Is. The ACC here is mostly concentrated in a narrow frontal zone of 2-3 deg of latitude, without any noticeable multi-band structure, as a result of the confluence of the Subantarctic and Subtropical Fronts. The Polar Front in the sector is not associated with any prominent current core. This regional particularity of the ACC was further supported by GEOSAT altimetry data. About 80% of the ACC transport (106 Sv; 1 Sv= million cu m/s) passes north of Kerguelen, concentrated along the northern flank of the Kerguelen Plateau; only 30 Sv passes south of Kerguelen. The bottom-pressure-derived barotropic transport variability at Kerguelen-Amsterdam passage was estimated to lie between 10 and 30 Sv, consistent with findings at Drake Passage. It is suggested that the study area constitute a prominent ACC observatory during the WOCE (World Ocean Circulation Experiment). (Auth. mod.)

J-46212
Veth, C., **Structure and evolution of the top layers of the water column across the marginal ice zone during spring 1988 in the Scotia-Weddell Sea sector of the southern ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.63-76, 19 refs.

The evolution of the wind-mixed layer and surface temperature in a period of ice retreat is studied with a one-dimensional turbulent erosion model. This model is established to provide values for a numbers of physical parameters to be used in ecophysiological modelling of plankton blooms in an area with a retreating ice cover. The wind-mixed layer (WML) model is driven by parameters obtained by regular on-board meteorological observations, visual ice cover estimates and global radiation measurements. The results of numerous conductivity-temperature-depth (CTD) casts performed during the EPOS leg-2 cruise provided the data for the initial conditions and validation. (Auth.)

J-46213
Murphy, P.P., **Autumn air-sea disequilibrium of CO2 in the South Pacific Ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner., p.77-84, 13 refs.

Accurate assessment of the role of the South Pacific in the global carbon cycle has been hindered by a paucity of data. In particular, the South Pacific has been suggested as a major sink for CO2 on the basis of measurements made principally in the western basin. The PMEL/NOAA Marine CO2 Program has made basin-wide CO2 measurements over 6 years which now permit estimation of surface CO2 fluxes during the austral autumn. These results suggest that the South Pacific is not a significant sink for atmospheric CO2 during the austral autumn. The study area extends to 60S. (Auth.)

J-46214
Metzl, N., Beauverger, C., Brunet, C., Goyet, C., Poisson, A., **Surface water carbon dioxide in the southwest Indian sector of the southern ocean: a highly variable CO2 source/sink region in summer,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.85-95, 37 refs.

Measurements of partial pressure of carbon dioxide (*p*CO2), total dissolved inorganic carbon (TCO2), total alkalinity (TA) and chlorophyll *a* have been made in surface water in the southwestern Indian sector of the southern ocean (20-85E) in the austral summer (INDIVAT V cruise, Jan.-Feb. 1987). Between Antarctica and Africa, *p*CO2 distribution was linked to the oceanic frontal zones and Chl *a* variations. The *p*CO2 spatial structure was very close to that explored in summer 1967 in the same region but the *p*CO2 differences between the ocean and the atmosphere were smaller in 1987 than 20 years ago. At all latitudes strongly contrasting surface *p*CO2 characteristics between eastern (around 80E) and western (around 25E) regions were found; CO2 sources were mainly in the west and CO2 sinks in the east. South of 60S, the contrast could be due to biological activity. Between 60S and the Antarctic Polar Front, intensification of upwelling might be responsible for the higher *p*CO2 values in the west. (Auth.)

J-46215
Schlosser, P., Bullister, J.L., Bayer, R., **Studies of deep water formation and circulation in the Weddell Sea using natural and anthropogenic tracers,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.97-122, 36 refs.

The application of natural and anthropogenic trace substances in oceanographic studies of the Weddell Sea is reviewed. The potential of some steady-state and transient tracers (tritium, CFC-11 and CFC-12, O-18, and helium isotopes) for studies of deep water formation and circulation is discussed on the basis of data sets collected mainly on cruises of R/V *Polarstern* to the Weddell Sea during the 1980s. CFC/tritium ratio dating of young water masses is applied to estimate mean age and transit times of water involved in Weddell Sea Bottom Water formation. The history of the CFC-11/tritium ratio through time is derived for Weddell Sea shelf waters. (Auth.)

J-46216
Bayer, R., Schlosser, P., **Tritium profiles in the Weddell Sea,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.123-136, 24 refs.

Tritium data were collected between 1985 and 1987 on several cruises of the German research icebreaker *Polarstern* to the Weddell Sea. Maximum tritium concentrations in the surface waters are of the order of 200 mTU. The minimum values observed in the Weddell Sea Deep Water at about 1000 m depth are about 15-40 mTU. The bottom waters show tritium concentrations of about 70-100 mTU in the central gyre, increasing to about 120 mTU in the northwestern corner of the Weddell Sea. The overflowing Ice Shelf Water observed on the continental slope west of the Filchner Depression has tritium concentrations close to those of the surface waters, indicating rapid renewal of this water mass. The data reflect the rapid renewal of the bottom waters in the northwestern corner of the Weddell Sea and the mixing of bottom water from this boundary current into the bottom waters of the central Weddell Gyre. (Auth.)

J-46217
Jean-Baptiste, P., Mantisi, F., Mémery, L., Jamous, D., **He-3 and chlorofluorocarbons (CFC) in the southern ocean: tracers of water masses,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.137-150, 19 refs.

The distribution of He-3 across the southern ocean is depicted on the basis of a meridional section between Antarctica and South Africa measured during the INDIGO-3 survey (1988). A core of *delta*He-3 values above 10% is observed south of the Polar Front, associated with very low CFC concentrations. This He-3 enriched layer is documented from the GEOSECS and INDIGO He-3 data in the southern ocean. It is found at a density level around *sigma, theta* =27.8 in all the waters close to Antarctica (i.e. south of 50S). Its zonal distribution suggests that is likely that it originates from the central/eastern Pacific. Hence, it provides an indication of the deep Pacific waters in the Antarctic Circumpolar Current, which are not easily detectable from the standard hydrographic parameters. (Auth.)

J-46218
Mantisi, F., Beauverger, C., Poisson, A., Metzl, N., **Chlorofluoromethanes in the western Indian sector of the southern ocean and their relations with geochemical tracers,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.151-167, 34 refs.

The first vertical profiles of chlorofluoromethanes are presented in relation to hydrological and geochemical characteristics. In the open ocean, transient tracer penetration reaches 1000 m. Off the West Ice Shelf and Enderby Land, a significant decrease in freons is found below the cold Winter Water and just above the upper Circumpolar Deep Water (200-400 m). In the region off Mac. Robertson Land, where the oxygen minimum is deeper (1000 m), the freon gradients are less abrupt. In deep open ocean waters, no freons were detected in the core of the Circumpolar Deep Water. However, near the continental shelf, freon minima associated with salinity maxima have been encountered. Over the whole water column, a strong zonal contrast emerges in tracer distributions between stations situated to the east and to the west of Mac. Robertson Land. Freon maxima associated with oxygen maxima and temperature and salinity minima which characterize Antarctic Bottom Water (AABW) have been found over all the region studied; the tracers indicate three main bottom waters that are related to Weddell Sea, Ross Sea and local origins. At two stations located on the edge of the continental shelf, freon measurements suggest that the AABW formation was recent, and the tracers' continuity reveals a preferential westward flow of bottom waters. (Auth. mod.)

J-46219
Fogelqvist, E., **Dimethylsulphide (DMS) in the Weddell Sea surface and bottom water,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.169-177, 22 refs.

Dimethylsulphide (DMS) has been measured in the Weddell Sea during the austral summer 1988-1989. In the summer Surface Water, which generally contained a maximum at 20-50 m depth, the concentrations were extremely high, up to 12,000 ng/l DMS, but showed a significant spatial variability. Data from the central part of the Weddell Sea show a steep gradient downwards, and below about 200 m depth, in the Weddell Sea Deep Water, concentrations were below the detection limit of 1 ng/l. The high-density Ice Shelf Water, when flowing down the continental slope, brings DMS down to the Weddell Sea Bottom Water in significant amounts before its eventual decay. (Auth.)

Lindegren, R., Anderson, L.G., **'NO' as a conservative tracer in the Weddell Sea,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.179-187, 14 refs.

The salinity maximum of the Warm Deep Water advecting into the Weddell Sea lies about 200 m below the temperature maximum and an NO minimum. The NO minimum is horizontally as well as vertically resolved on two sections towards the eastern and southern coast of the Weddell Sea, one towards Cape Norvegia, the other towards the Filchner Ice Shelf, whereas the temperature and salinity maxima are horizontally resolved on the former section only. Thus NO is a valuable complementary tool for studying the boundary current along the coast of the Weddell Sea. The NO signal indicates a non-continuity within the boundary current, as the minimum in the downstream section is deeper than the upstream one. The temperature maximum as well as the NO minimum descend from a depth of about 400 m in the Cape Norvegia section to about 600 m in the Filchner Ice Shelf section, the salinity maximum being correspondingly lowered. A plot of NO vs. salinity shows a continuous mixing line between Warm Deep Water and the freshest part of the Winter Water interval, thus essentially displaying Winter Water as itself lying on a mixing line. This indicates that Warm Deep Water is being advected well into the winter surface layer. (Auth.)

Prego, R., **Total organic carbon in the sea-ice zone between Elephant Island and the South Orkney Islands at the start of the austral summer (1988-89),** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.189-197, 17 refs.

During an antarctic survey carried out on board on R/V *Professor Siedlecki* (26 Dec. 1988-18 Jan. 1989) seawater samples were collected from nine depths, from the surface to 150 m, at 29 stations near the pack-ice in a zone of the Weddell-Scotia Confluence between Elephant I. and the South Orkney Is. The samples were analyzed for total organic carbon (TOC) and silicate concentrations. The two main water masses in the sampling area, coming from the Drake Passage and Weddell Sea, are well-defined, using silicate as a tracer. The concentrations of TOC are higher than 100 *micro*M and are associated with low silicate concentrations. However, in the deep water influenced by the Weddell Sea the concentrations of TOC are about 30 *micro*M. (Auth.)

Westerlund, S., Öhman, P., **Iron in the water column of the Weddell Sea,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.199-217, 20 refs.

Total, dissolved and suspended iron has been determined in the water column of the Weddell Sea area during the austral summer 1988-1989. Some data are also presented for dissolved manganese, suspended manganese and suspended aluminum. The average value for dissolved iron was found to be 1.2 nM, with somewhat higher values at the Filchner Ice Shelf. The total iron was found to be considerably higher, with a range between 1 and 6 nM in the central Weddell Sea and 1 to 25 nM at the shelves. Transport of iron from the shelves into the Weddell Sea basin is demonstrated. This is observed both for total and dissolved iron. (Auth.)

Nolting, R.F., De Baar, H.J.W., Van Bennekom, A.J., Masson, A., **Cadmium, copper and iron in the Scotia Sea, Weddell Sea and Weddell/Scotia Confluence (Antarctica),** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.219-243, 61 refs.

Until recently, little was known about trace metals in the southern ocean. Vertical profiles and surface water sections along 49W exhibit Cd concentrations of 0.2-0.8 nM, increasing with depth as for phosphate. A linear relationship between Cd and phosphate exists as in other oceans; however, the Cd/P slope at about 0.63-0.65 nM/*micro* M is much higher than the generally assumed global deep water ratio of about 0.35-0.4 nM/*micro*M. Dissolved Cu levels range from 1 to 4 nM, increasing with depth, as for silicate. The linear relationship between Cu and silicate shows the same linear trend as in the North Atlantic Ocean, except for the shallow (less than 100 m) antarctic waters. The South Orkneys shelf appears to be a source of dissolved Cu. Dissolved Fe levels range from 2 to 8 nM in the surface waters. Deep water Fe levels are similar. Over the South Orkneys shelf dissolved Fe is an order of magnitude higher (about 60 nM). Shelf sediments appear to be a major source for Fe; transport of weathered material by ice(bergs) may also contribute Fe to seawater. (Auth.)

Smith, W.O., Jr., **Nutrient distributions and new production in polar regions: parallels and contrasts between the Arctic and Antarctic,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.245-257, 37 refs.

This paper discusses the influences of nitrate and ammonium concentrations on nitrate uptake (and hence new production), particularly with regard to data collected within marginal ice zones in the Arctic and Antarctic. Subsurface ammonium maxima in waters over 150 m are frequently encountered in the Arctic and occasionally in the Antarctic. Such maxima result from the heterotrophic remineralization of organic matter, and because stratified environments occur more frequently in the Arctic, significant concentrations of ammonium accumulate as a result of lower diffusive losses. Causal agents (bacteria vs. zooplankton) may also be different in the Arctic from those in the Antarctic. Elevated ammonium concentrations significantly reduce nitrate uptake, and it is suggested that this nutrient interaction may play a significant role in controlling new production, particularly in open water regions. The new production of the southern ocean is estimated, and it is suggested that the production and flux from the surface layer is significant relative to the world's oceans. (Auth.)

Liebezeit, G., Bölter, M., **Water-extractable carbohydrates in particulate matter of the Bransfield Strait,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.389-398, 27 refs.

Water-extractable carbohydrates were determined in particulate material sampled in the Bransfield Strait in Dec. 1980. These compounds accounted on average for 1.3% of total organic carbon, although extreme values of 0.3 and 4.6% were encountered. Glucose was the dominant monosaccharide in this fraction, followed by other hexoses. Statistical data treatment results in four distinct regional clusters which only partly coincide with zonations defined from plankton observations. (Auth.)

Dehairs, F., Stroobants, N., Goeyens, L., **Suspended barite as a tracer of biological activity in the southern ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.399-410, 29 refs.

During two cruises in the southern ocean (INDIGO 3, Indian sector and EPOS 2, Scotia-Weddell Confluence) suspended matter samples were collected for analysis of several biogenic elements including Ba, Si and particulate organic carbon (POC). The good agreement between particulate barium in subsurface water with oxygen minimum concentrations as well as with nitrate depletions suggests that it reflects the intensity of new production over the past season. As a consequence of new production in the southern ocean being performed mainly by diatoms, the occurrences of barite and diatoms are related in the water column. In areas characterized by diatom-poor phytoplankton, barite does occur, but in lower concentrations. (Auth.)

J-46237

Stroobants, N., **Barite formation in the southern ocean water column,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.411-421, 24 refs.

The intensity of past biological activity can be correlated with the occurrence of suspended and sedimented barite ($BaSO_4$). During the EPOS-2 cruise (Nov.-Dec. 1988), situated in the Scotia Sea-Weddell Sea Confluence, suspended matter samples were taken for analysis of total Ba by ICP/AES and for SEM/EMP. The vertical profiles of particulate barium generally show a Ba maximum between 200 and 500 m. SEM-EMP investigations on Scotia-Weddell Sea Confluence profiles provide a possible explanation for the origin of this subsurface Ba maximum. In the surface waters (i.e. above 200 m) barite is mainly contained within large bioaggregates. In some cases high Ba concentrations are present in the first 10-20 m of the water column, occasionally coinciding with biomass parameter maxima. This correlation suggests active precipitation by the living phytoplankton cell (i.e. intravacuolar barite formation), as already observed by others for cultures of marine algae (Pavlovales). SEM/EMP investigations on INDIGO 3 and EPOS-2 samples did not reveal any association of barite with identifiable phytoplankton individuals. Thus, SEM/EMP evidence favors passive precipitation in saturated microenvironments as the process involved in formation of pelagic barite. (Auth. mod.)

Van Bennekom, A.J., Buma, A.G.J., Nolting, R.F., **Dissolved aluminium in the Weddell-Scotia Confluence and effect of Al on the dissolution kinetics of biogenic silica,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.423-434, 32 refs.

In the Scotia and Weddell Seas the concentration of dissolved Al was 1-1.5 nM in ice-free surface waters, up to 3 nM in ice-covered waters and about 2.6 nM in bottom waters. The solubility and the dissolution rate of diatomaceous silica, obtained from net samples and from incubations in the presence or absence of dissolved Al, were inversely related to solid-phase Al/Si ratios. At *in situ* temperatures, dissolution rates for antarctic diatoms are higher than those for diatoms from temperate regions. Effects on distribution patterns of silicic acid in the Weddell Sea are discussed. (Auth.)

J-46239

Leynaert, A., Tréguer, P., Quéguiner, B., Morvan, J., **Distribution of biogenic silica and the composition of particulate organic matter in the Weddell-Scotia Sea during spring 1988,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.435-447, 27 refs.

During EPOS 2, Nov. 26, 1988-Jan. 5, 1989, the distribution of biogenic silica (BSi) was determined from the surface to 600 m along two transects (49W and 47W) spanning the Scotia Sea, the Weddell-Scotia Confluence (WSC) and the marginal ice zone (MIZ) of the Weddell Sea. Particulate organic carbon (POC), particulate organic nitrogen (PON) and chlorophyll *a* concentrations were determined in parallel in surface (10 m) samples. In the 0-100 m layer, the distribution of particulate showed little correlation with the meltwater field in late Nov. High BSi concentrations were measured at the end of Nov. in the WSC and early in Jan. in the ACC where the wind-mixed layer was only 35 m, creating favorable conditions for phytoplankton growth. However, maximum and mean biogenic silica values remained fairly low as compared with those reported for the Ross Sea. This relatively low silica content of the 0-100 m layer appears to be mainly due to intense grazing which resulted in rapid export of particulate material towards the deeper layers. The mean POC/PON molar ratio was 5.5, i.e. significantly lower than the usual Redfield ratio. BSi/POC molar ratios ranged from 0.01 to 0.61, the highest values being found in the Scotia Sea, where siliceous phytoplankton was dominant. The high BSi/POC ratios confirm that diatoms in the antarctic ocean are able to incorporate unusually high amounts of Si relative to carbon, as compared with other ecosystems. (Auth.)

DeMaster, D.J., Nelson, D.M., Harden, S.L., Nittrouer, C.A., **Cycling and accumulation of biogenic silica and organic carbon in antarctic deep-sea and continental margin environments,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.489-502, 25 refs.

Rates of biogenic silica and organic carbon accumulation are reported for antarctic deep-sea and continental margin deposits. Naturally occurring radionuclides (Ra-226, Pa-231, and Th-230) were used to establish rates of sediment accumulation in the rapidly accumulating siliceous deposits beneath the Antarctic Polar Front. The rates were as high as 20-180 cm/ka, and when coupled with biogenic silica and organic carbon measurements, yield accumulation rates as high as 35 mg/sq cm/yr for silica and 0.3 mg/sq cm/yr for organic carbon. SiO_2/organic C weight ratios in Polar Front sediments are typically about 100, although values as high as 300 were measured. Considering that the SiO_2/organic C ratio in Polar Front plankton ranges from 0.5 to 2, the high ratios observed in Polar Front sediments indicate that during settling and burial an enrichment of 50 to 600-fold occurs in biogenic silica relative to organic carbon. Approximately 25-50% of the gross silica production in surface waters is preserved in the seabed, in contrast to less than 5% of the organic carbon. In some of the continental margin environments, lateral transport of biogenic material can create local areas where the rate of silica accumulation is as much as 70% of the production in the overlying water column. In the southern ocean environments examined in this study, biogenic silica is preferentially preserved in the sedimentary record relative to organic carbon. This trend is consistent with the greater role of southern ocean deposits in the global silica cycle as compared with the organic carbon cycle. (Auth. mod.)

Abelmann, A., Gersonde, R., **Biosiliceous particle flux in the southern ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.503-536, Refs. p.533-536.

The flux of diatom valves and radiolarian shells obtained during short-term and annual sediment trap experiments at localities in the Atlantic sector of the antarctic ocean (Drake Passage, Bransfield Strait, Powell Basin, NW and SE Weddell Sea and the Polar Front north of Bouvet I.) is summarized and discussed. The deployment of time-series sediment traps provided annual flux records between 1983 and 1990. The biosiliceous particle flux is characterized by significant seasonal and interannual variations. Interannual differences in the particle flux range over a factor of 10. Grazers play an important role in controlling the quantity, timing and pattern of the vertical biosiliceous particle flux. During their transfer through the water column to the ocean floor, the composition of the biosiliceous particles is altered mechanically (breakdown by grazing zooplankton) and by dissolution, which significantly affects especially diatoms and phaeodarians in the upper portion of the water column and at the sediment-water interface. Significant lateral transport of suspended biosiliceous particles was observed in the bottom water layer in regions adjacent to shelf areas (Bransfield Strait), and in the vicinity of topographic elevations (Maud Rise), indicating considerable redistribution of biogenic silica in these regions. (Auth. mod.)

J-46245

Bareille, G., **Biogenic silica accumulation rate during the Holocene in the southeastern Indian Ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.537-551, 33 refs.

Three box-core transects were selected in the southeastern Indian Ocean to establish the variability of biogenic silica accumulation rate in the main subsystems of the southern ocean. *Cycladophora davisiana* and *delta*O-18 chronologies, previously calibrated by C-14 dates, and biogenic silica contents determined by X-ray diffraction analysis, were used to calculate accumulation rates. Concurrently, a transfer function was used to quantify the silica loss during the biogenic particulate accumulation in the deep-sea sediments. The average rate of biogenic silica rain on the sea-floor, calculated from the accumulation rate and the amount of dissolved biogenic silica, ranges from less than 0.1 to 16 g opal/sq cm k/a. During the Holocene, biogenic silica has accumulated at the highest rates on the Southeast Ridge, south of the Polar Frontal Zone. To the north and south, the accumulation rate drops where summer sea surface temperatures are above 8 C or lower than 2 C. Biogenic silica dissolution is maximum in the marginal sea ice zone. Accumulation rates of biogenic silica can be a useful index to estimate changes of palaeoproductivity in the southeastern Indian Ocean, although there is no strict proportionality between accumulation and silica rain rates. (Auth.)

Van der Loeff, M.M.R., Berger, G.W., **Scavenging and particle flux: seasonal and regional variations in the southern ocean (Atlantic sector),** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.553-567, 48 refs.

Even with large variations in flux rates, the scavenging of Pb and Th remains closely coupled to particle flux. In the Bransfield Strait, more than 9% of the scavenging of Th-230 and Pb-210 occurs in two productive months, followed by negligible fluxes in winter. In winter, total Th-234 reaches equilibrium with its parent U-238. During the bloom period, it is rapidly adsorbed onto particles and removed from the surface water. Notwithstanding the short production period, the annual fluxes of Th-230xs and Pb-210xs (the subscript xs designates unsupported value) exceed their respective production rates in the water column by 60%. Pb-210xs inventories in the sediment reflect the distribution of average present-day particle flux: high inventories occur in a zone just south of the Polar Front, including the Bransfield Strait and Drake Passage; low inventories are found north of the Polar Front and in the Weddell Sea, with minimum values (4-5 dpm/sq cm) in the central Weddell Gyre. This distribution is in agreement with data for primary production and oxygen penetration in the sediment. However, inventories are determined not only by particle fluxes but also by sediment focusing and hydrography. A general relationship between radionuclide fluxes and particle rain rates as a tool for hindcasting palaeoproductivities cannot be given. (Auth.)

J-46247

Schlüter, M., **Organic carbon flux and oxygen penetration into sediments of the Weddell Sea: indicators for regional differences in export production,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.569-579, 21 refs.

The flux of reactive organic carbon (Corg) into sediments of the southern and eastern Weddell Sea was estimated by modelling measured oxygen and nitrate pore-water profiles. Highest flux of reactive organic carbon into the sediment was calculated for the shelf region (500 and 600 mmol C/sq m/yr, whereas for pelagic and continental slope sediments Corg fluxes of less than 60 mmol C/sq m/yr and 100-200 mmol C/sq m/yr respectively were calculated. The oxygen penetration depth (OPD) ranged from less than 2 cm in shelf sediments to much greater than 40 cm in pelagic sediments. For the first time, sediments covered by the Filchner Ice Shelf (probably cut off from a source of primary production for a few decades) were sampled. In this area a restricted vertical flux of reactive organic carbon was expected. However, the Corg content of these sediments was as high as that of antarctic shelf sediments, which suggests lateral transport of organic matter. In contrast, pore-water profiles and calculated reactive organic carbon fluxes off Filchner Ice Shelf are similar to those of much deeper depositional environments (3000-4000 m water depth). (Auth.)

J-46248

Fischer, G., **Stable isotope ratios of plankton carbon and sinking organic matter from the Atlantic sector of the southern ocean,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.581-596, 44 refs.

The stable carbon isotope composition of particulate organic carbon (POC) from plankton, sediment trap material and surface sediments from the Atlantic sector of the southern ocean were determined. Despite low and constant water temperatures, large variations in the *delta*C-13 values of plankton were measured. C-13 enrichments of up to 100 per mill coincided with a change in the diatom assemblage and a two-fold increase in primary production. Increased CO2 consumption as a result of rapid carbon fixation may result in diffusion limitation reducing the magnitude of the isotope fractionation. The *delta*C-13 values of plankton from sea-ice cores display a relationship with the chlorophyll *a* content. High 'ice-algae' biomass, in combination with a limited exchange with the surrounding seawater, results in values of about -18 to -20 per mill. It is assumed that these values are related to a reduced CO2 availability in the sea-ice system. In comparison with plankton, sinking krill faeces sampled by traps can be enriched by 2-5 per mill in C-13 (e.g. central

Bransfield Strait). In contrast, the transport of particles in other faeces, diatom aggregates or chains results in minor isotope changes (e.g. Drake Passage, Powell Basin, NW Weddell Sea). A comparison between the *delta*C-13 values of sinking matter and those of surface sediments reveals that C-13 enrichments of up to 3-4 per mill may occur at the sediment-water boundary layer. These isotopic changes are attributed to high benthic respiration rates. (Auth.)

J-46249

Wefer, G., Fischer, G., **Annual primary production and export flux in the southern ocean from sediment trap data,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.597-613, 46 refs.

Since 1983, time-series traps have been deployed in the Atlantic sector of the southern ocean to measure the flux of organic carbon, biogenic silica and carbonate. The organic carbon flux data are used to calculate primary production rates and organic carbon fluxes at 100 m water depth. From these calculations, annual primary production rates range from about 170 gC/sq m in the coastal area (Bransfield Strait) to almost zero in the Permanent Sea-Ice Zone. High rates (of about 80 gC/sq m/yr) were calculated for the Polar Front Zone and rather low values (about 20 gC/sq m/yr) characterize the Maud Rise area. The estimated primary production for the entire southern ocean (south of 50S), using various subsystems with characteristic carbon fluxes, is on the order of 1 billion tons/yr; the organic carbon flux out of the photic layer is 170 million tons/yr. The authors' calculation of the southern ocean total annual primary production is substantially lower than previously reported values. (Auth.)

J-46250

Treguer, P., **Conclusions of the symposium,** *Marine chemistry,* Nov. 1991 35(1-4), Symposium on Biochemistry and Circulation of Water Masses in the Southern Ocean, July 1990. Proceedings. Edited by P. Tréguer and B. Quéguiner, p.615-619.

Two key questions emerge from the papers and discussions presented at this meeting: is the southern ocean a contemporary sink or source for atmospheric CO2; and in previous glacial-interglacial climate change, did the southern ocean lead climate change, or did it follow it? Following these, it is clear that the southern ocean cannot be considered as a single functional unit. In the perspective of modelling fluxes by biogenic matter, five functional areas of the southern ocean are outlined: frontal systems including the Polar Front Zone (PFZ), Permanently Open Ocean Zone (POOZ), Seasonal Sea-Ice Zone (SIZ), Coastal and Continental Shelf Zone (CCSZ) and the Zone of the Islands (IZ). Several talks also highlighted the variability within smaller areas, and clearly such patchiness also needs to be quantified. (Auth.)

Smith, W.O., Jr., Kelly, H.P., Rich, J.H., **Chlorophyll distribution and primary productivity in the Ross Sea, austral summer 1990,** *Antarctic journal of the United States,* 1990 25(5), p.179-182, 7 refs.

Phytoplankton distribution and primary productivity were measured in samples collected from Jan. 12 to Feb. 10, 1990, along two transects perpendicular to the ice edge and the Victoria Land coastline, in the Ross Sea. The study tested whether a latitudinal gradient in surface biomass and productivity exists. Results show elevated chlorophyll concentrations throughout the region. Primary productivity was also very high. Vertical distribution of density and chlorophyll in micrograms/l along the southern and northern transects, respectively, are shown in figures. It is concluded that such a large productivity indicates that during the summer season, large amounts of biogenic matter are potentially available for export to subeuphotic depths and to the underlying sediments.

Ferreyra, G.A., Alder, V.A., **Daily variability of phytoplankton and oceanographic parameters during the fall in Arthur Harbor,** *Antarctic journal of the United States,* 1990 25(5), p.208-209, 8 refs.

A survey of several biological and physicochemical parameters was carried out in Arthur Harbor from Mar. 21 to Apr. 22, 1990. The study focused on the high-frequency temporal variability of phytoplankton at the end of the fall growth period. Throughout the study, chlorophyll *a* values decreased consistently, in agreement with decreasing incident radiation, temperature and pH. The decrease in pH values is interpreted as reflecting a transition from a situation dominated by primary productivity to one where heterotrophic activity became increasingly important. Results suggest a high degree of adaptability of the dominant phytoplankton assemblages to the adverse light conditions characteristic of the late fall.

Nelson, D.M., Smith, W.O., Jr., **Sverdrup revisited: critical depths, maximum chlorophyll levels, and the control of southern ocean productivity by the irradiance-mixing regime,** *Limnology and oceanography,* Dec. 1991 36(8), p.1650-1661, 51 refs.

A reformulation of Sverdrup's critical-depth calculation, using recent optical and physiological information, is developed and applied to data from the southern ocean. Comparisons between calculated critical depths (Zc) and mixed-layer depths (Zm) indicate that both the marginal ice zone and the open waters of the Antarctic Circumpolar Current provide favorable irradiance-mixing regimes for the initiation and early development of phytoplankton blooms in summer, i.e. $Zc > Zm$ when phytoplankton biomass is low and the water clear; that when ice-edge blooms develop, Zc shoals to depths about equal to Zm, implying that phytoplankton standing stocks in ice-edge blooms may be self-limiting as a result of reduced penetration of irradiance; and that the highest chlorophyll levels that can be sustained in summer in open waters not stabilized by meltwater are 1.0 microgram/liter in the Weddell and Scotia Seas, and may be less in areas that experience stronger winds. (Auth.)

J-46287

Mitchell, B.G., **Light limitation of phytoplankton biomass and macronutrient utilization in the southern ocean,** *Limnology and oceanography,* Dec. 1991 36(8), p.1662-1677, 72 refs.

The Antarctic Circumpolar Current (ACC) is unique in that it has continually high concentrations of major plant nutrients but low phytoplankton biomass. This enigmatic phenomenon is the focus of significant speculation that trace nutrients, including Fe, may limit phytoplankton crop size. Global climatologies indicate that the ACC is a region with low surface temperatures, weak density stratification, little summertime surface solar irradiance, and strong wind stress. These physical phenomena act to limit growth rates of the phytoplankton community. Using a photophysiological description of phytoplankton growth in a simple one-dimensional ecosystem model forced by observations or climatologies of mixing depth and surface irradiance, an evaluation is made of the potential for massive, nutrient-exhausting, phytoplankton blooms forming in the ACC. The ACC has persistent mixed layers in excess of 50 m. Literature values and model optimization indicate that the minimal aggregate specific loss rate for phytoplankton, including respiration, sinking, and grazing, is 0.2/d. For a minimal loss rate and typical physical conditions of stratification and surface irradiance, the model predicts that phytoplankton in the ACC would not utilize over 10% of the available macronutrients. Without a mechanism for increasing the strength of stratification, the authors predict that massive Fe additions to the southern ocean would fail to significantly mitigate the atmospheric CO2 derived from fossil fuel. (Auth.)

Dugdale, R.C., Wilkerson, F.P., **Low specific nitrate uptake: a common feature of high-nutrient, low-chlorophyll marine ecosystems,** *Limnology and oceanography,* Dec. 1991 36(8), p.1678-1688, 54 refs.

A search was made for common features of three high-nutrient, low-chlorophyll (HNLC) regions of interest in the southern ocean, the eastern equatorial Pacific, and Station P in the northeast Pacific. In each of these areas, the rates of specific NO3 uptake, whether normalized to particulate organic nitrogen (PON) or chlorophyll, are low compared to coastal upwelling systems with comparable nutrient concentrations. One possible reason for the lack of high VN-15O3 values in the HNLC regions is that seeding of the large, fast-growing, fast-sinking diatoms is inadequate, and primarily due to the lack of a bottom or other recirculation system to assure a supply of these diatoms to the surface regions. Grazing control limits biomass development and may function to hold VN-15O3 to low values resulting in conditions certain to appear as HNLC. Comparison with model results suggests that deep mixed layers in the southern ocean and at Station P may limit VN-15O3. Strong dependence on temperature of N and C uptake in psychrophilic antarctic phytoplankton and sea-ice algae may be a dominant factor in constraining VN-15O3 to low values in the southern ocean. (Auth. mod.)

Martin, J.H., Gordon, R.M., Fitzwater, S.E., **Case for iron,** *Limnology and oceanography,* Dec. 1991 36(8), p.1793-1802, 25 refs.

Excess major nutrients occur in offshore areas ranging from the tropical equatorial Pacific to the polar Antarctic. In spite of the great ecological differences in these environments, the authors believe they share a common trait: iron deficiency. Presented here is the case for iron; it is pointed out that all of these areas are far from Fe-rich terrestrial sources and that atmospheric dust loads in these regions are amongst the lowest in the world. A summary is given of experiments performed in three nutrient-rich areas: the Gulf of Alaska, the Ross Sea, and the equatorial Pacific. In general, populations without added Fe doubled at rates 11-40% of the expected maxima at various temperatures. The addition of nanomole quantities of Fe increased these doubling rates by factors of 2-3. In spite of the lack of Fe, tightly coupled phytoplankton/zooplankton communities seem to inhabit these major nutrient-rich areas. Since Fe is required for the synthesis of chlorophyll and nitrate reductase, little chlorophyll is found and NH3 is the favored N source. Normal rate values of specific productivity indicate that these populations are healthy, but limited by the insufficient Fe supply. When Fe becomes available either artificially in bottle experiments or in the environment as Fe-rich land masses are approached, diatoms quickly bloom, chlorophyll levels increase, and nutrient stocks are rapidly depleted. These combined results indicate that Fe availability is the primary factor controlling phytoplankton production in nutrient-rich areas of the open seas. (Auth.)

Handa, N., Nakatsuka, T., Fukuchi, M., Hattori, H., Hoshiai, T., **Vertical fluxes and ecological significance of organic materials during the phytoplankton bloom during austral summer in Breid Bay, Antarctica,** *Marine biology,* Mar.1992 112(3), p.469-478, 54 refs.

A mooring system consisting of an *in situ* fluorometer at a depth of 50 m and a time-series sediment trap at a depth of 110 m was deployed at the sediment trap site (70 deg 11.536 secS; 24 deg 18.679 secE; water depth: 300 m) in Breid Bay from Dec. 28, 1985 to Feb. 13, 1986. Sinking particles, consisting of diatoms (mainly *Thalassiosira antarctica),* were analyzed for organic materials, stable carbon and nitrogen isotopes. Vertical fluxes of organic carbon and nitrogen were determined to be within the ranges of 12.3 to 116 mg C/sq m/d and 1.79 to 15.4 mg N/sq m/d, respectively, with maxima in the middle of Jan. 1986, after which time the organic carbon and nitrogen fluxes tended to decrease with a steep gradient. Fifteen species of protein amino acids with trace amounts of *beta*-alanine, *gamma*-aminobutyric acid and ornithine were found in the sinking particles upon acid hydrolysis, but the amino acid composition of these samples had not been affected much by biological agents. The essential amino acid index was calculated for the sinking particles collected in the course of the sediment trap experiment. The indices obtained indicated that the sinking particles collected in Breid Bay were more ecologically significant than the sinking and suspended particles from deep waters. (Auth. mod.)

Mitchell, B.G., **Predictive bio-optical relationships for polar oceans and marginal ice zones,** *Journal of marine systems,* Mar. 1992 3(1-2), p.91-105, Refs. p.104-105.

An analysis of more than 500 stations from polar seas was undertaken to evaluate predictive models linking *in situ* phytoplankton pigment concentrations to measurable optical parameters. The data set consists of profiles of spectral downwelling irradiance, upwelling radiance, chlorophyll and phaeopigments from 3 cruises to the Antarctic Peninsula, one cruise to the Barents Sea and one cruise to Fram Strait in the Greenland Sea. The pigment-specific diffuse attenuation coefficient for polar regions is significantly smaller, particularly in the blue region of the spectrum, than previous statistical models for temperate oceans predict. Phytoplankton remote sensing pigment retrieval algorithms show significant differentiation from temperate ocean models. The presently recommended water-leaving radiance algorithm for Coastal Zone Color Scanner data processing underestimates surface pigment concentrations by more than a factor of two for the polar observations reported here. The observations are interpreted in the context of variations in pigment-specific particulate absorption which have been described elsewhere. Specifically, the magnitude of pigment-specific absorption coefficient in the blue is hypothesized to be smaller for polar regions due to significant pigment packaging effects, and a relatively small amount of detrital absorption compared to phytoplankton absorption. Implications for remote sensing of phytoplankton pigments and pigment-based models of light propagation in the ocean are discussed. (Auth. mod.)

Muench, R.D., **Weddell-Scotia marginal ice zone: physical oceanographic conditions, geographical and seasonal variability,** *Journal of marine systems,* Mar. 1992 3(1-2), p.169-182, 22 refs.

Physical oceanographic conditions were measured in the Weddell and Scotia Sea marginal ice zones (MIZ's) during 1983, 1986 and 1988. The field work encompassed spring, autumn and mid-winter periods and included retreating, advancing and steady-state ice edges. Observed upper ocean structures, which typify MIZ's and reflect input of low salinity water from melting ice, included low salinity layers, lenses and fronts. An upper mixed layer was always present and was generally more fully developed in autumn and winter than at other times of year. Conditions in the deeper waters reflected regional oceanographic processes, and significant differences were present between the Weddell and Scotia Seas. The colder, denser Weddell water appeared to have mixed isopycnally with deeper water in the Scotia Sea, present there at depths exceeding 500 m. The Scotia Sea was dominated by strong gradients and energetic mesoscale features, with currents exceeding 50 cm/s. The northwestern Weddell Sea had, in contrast, current speeds well below about 5 cm/s and small to negligible lateral water property gradients. These observations suggest that the Weddell western boundary current was weaker than has been estimated in the past. In addition, scant evidence was found of deep winter convection in the Scotia Sea, a process which has been hypothesized in the past to contribute to deep water formation. No evidence was found during winter 1988 in the Scotia Sea of the modified water known as Weddell-Scotia Confluence water. (Auth. mod.)

Broecker, W.S., Peng, T.H., **Interhemispheric transport of carbon dioxide by ocean circulation,** *Nature,* Apr. 16, 1992 356(6370), p.587-589, 19 refs.

Although anthropogenic emissions of carbon dioxide have today created a greater atmospheric CO2 concentration in the Northern than in the Southern Hemisphere, a comparison of interhemispheric CO2 profiles from 1980 and 1962 indicated that before the Industrial Revolution, natural CO2 sources and sinks acted to set up a reverse (south to north) gradient which drove about one gigatonne of carbon each year through the atmosphere from the Southern to the Northern Hemisphere. At steady state, this flux must have been balanced by a counter flow of carbon from north to south through the ocean. Presented here is a means to estimate this natural flux by a separation of oceanic carbon anomalies into those created by biogenic processes and those created by CO2 exchange between the ocean and atmosphere. Before the Industrial Revolution, deep water formed in the northern Atlantic Ocean carried about 0.6 gigatonnes of carbon annually to the Southern Hemisphere. The existence of this oceanic carbon pump also raises questions about the need for a large terrestrial carbon sink in the Northern Hemisphere to balance the present global carbon budget. (Auth. mod.)

Dehairs, F., Goeyens, L., Stroobants, N., Mathot, S., **Elemental composition of suspended matter in the Scotia-Weddell Confluence area during spring and summer 1988 (EPOS Leg 2),** *Polar biology,* Apr. 1992 12(1), EPOS European Polarstern Study, Proceedings. No.1, p.25-33, Refs. p.32-33.

During spring and summer 1988 the upper 500 m of water column in the Scotia-Weddell Confluence was sampled for the elemental composition of total suspended matter. For particulate organic carbon, surface water concentrations ranged between 2.5 and 15 micromol/l, with an estimated 19 to 47% of this pool being detrital carbon. In late Nov., the highest surface water particulate organic carbon concentrations occurred in the Confluence area where they coincided with a maximum in particulate Si. Later in the season, particulate Si in the Confluence area decreased. In the Scotia Sea, surface water particulate Si increased with time. For particulate Ca and Sr in surface water, strong gradients are observed across the Scotia Front, with highest concentrations in the Scotia Sea. In the Scotia Sea, heavily calcified coccolithophorids and diatoms occurred throughout the season, while in the Confluence area heavily calcified coccolithophorids were absent and a switch-over from diatom to naked flagellate dominance was observed following a krill event. In the surface waters, the lithogenic Si fraction represents on average only 4% of the total particulate Si content. However, this fraction reaches 60% below 100 m depth in the Confluence area, due mainly to the presence of a subsurface maximum in the aluminosilicate load. Subsurface Ba/barite concentrations are highest in the Scotia Sea and decrease through the Scotia Front. (Auth. mod.)

Cadée, G.C., González, H.E., Schnack-Schiel, S.B., **Krill diet affects faecal string settling,** *Polar biology,* Apr. 1992 12(1), EPOS European Polarstern Study, Proceedings. No.1, p.75-80, Refs. p.79-80.

Free-floating sediment traps used on a transect from the Scotia Sea to Weddell Sea collected larger and more degraded krill faecal strings in the deeper (150 m) than in 50 or 75 m traps. The smallest faecal strings were only present in the shallower traps. Sinking velocity of smaller faecal strings was, as expected, much lower than for larger ones, with a total range of 50 to 800 m/day for faecal string volumes of 0.007 to 0.53 cu mm. Krill feeding largely on diatoms produced faeces with higher settling velocity than those feeding on non-diatom phytoplankton. Smaller krill faecal strings do not leave the upper mixed layer. Potential settling velocities as measured in settling tubes (without turbulence) may in this respect be misleading. Small oval faecal pellets of unknown origin showed relatively high settling velocities (80 to 250 m/day for 0.002 to 0.013 cu mm) due to higher compaction and lower form resistance to sinking. (Auth.)

J-46384

González, H.E., **Distribution and abundance of krill faecal material and oval pellets in the Scotia and Weddell Seas (Antarctica) and their role in particle flux,** *Polar biology,* Apr. 1992 12(1), EPOS European Polarstern Study, Proceedings. No.1, p.81-91, Refs. p.90-91.

The abundance and depth distribution of zooplankton faeces in spring to early summer were investigated along meridional transects that extended from the Scotia Sea across the Weddell-Scotia Confluence and into the Weddell Gyre. Krill faecal strings and oval faecal pellets of unknown origin were by far the most important zooplankton faeces, and highest concentrations were always found in the Confluence, often close to the ice border. Krill faeces were usually more abundant in the uppermost layer (0-50 m) where they contributed an average of 130 micrograms dry weight/cu m. There was an exponential decrease with depth. Oval pellets were more evenly distributed in the upper 1000 m of the water column, with an average of 9 micrograms dry weight/cu m. Consecutive collections (day-night) of krill faeces using drifting sediment traps showed that only the larger strings sank from 50 to 150 m depth. Peritrophic membranes appeared to deteriorate during sinking. Diatoms (in particular *Nitzschia* and *Thalassiosira* spp.) contributed by far the bulk of material in krill and oval faeces. In samples collected near or under the pack ice, remains of crustaceans in both krill- and oval faeces were also found. (Auth. mod.)

Burton, D., Moore, G.J., Fitzgerald, W.J., **Bayesian model selection and parameter estimation,** Signal Processing V. Theories and Applications. EUSIPCO-90, European Signal Processing Conference, 5th, Barcelona, Spain, Sep. 18-21, 1990. Proceedings. Vol.1, Amsterdam, Elsevier, 1990, p.221-224, 6 refs.

DLC TK5102.5.E9

A Bayesian model selection and parameter estimation algorithm is introduced for use in analyzing sea floor pressure variation. The use of Bayes theorem allows the inclusion of prior information regarding the models and model parameters, and permits the removal of parameters which are of no interest. Examples are the inclusion of the noise autocorrelation function for the case of non-Gaussian noise and the removal of the amplitude and phase information from sinusoidal model functions. These techniques are applied to the analysis of artificial transients in short data records and the analysis of an original time series consisting of 383 hourly measurements of the sea floor pressure beneath the Bellingshausen Sea, Antarctica. Marsh, J.G., **Global mean sea surface based upon GEOS 3 and Seasat altimeter data,** *Journal of geophysical research,* Apr. 10, 1992 97(B4), p.4915-4921, 21 refs.

A mean sea surface relative to the International Union of Geodesy 1980 Geodetic Reference System reference ellipsoid has been derived from Seasat and GEOS 3 altimeter measurements. This surface, called MSS-9012, has been computed on a grid of 1/8 deg resolution. Each elevation value was calculated by fitting all data within 111 km to a local biquadratic surface using Bayesian least squares. Individual data points were weighted inversely to the square of the distance to the grid location in the gridding process. The surface covers the global ocean between 70N and 72S. In the vicinity of sea ice the altimeter heights have been corrected for the on-board tracker error that occurs over non-Gaussian surfaces. Comparisons are made between MSS-9012 and ocean bathymetry. The combination of data from the two satellites has successfully retrieved more information about the sea surface than was previously possible using only Seasat data. (Auth. mod.)

Moran, S.B., Moore, R.M., Westerlund, S., **Dissolved aluminum in the Weddell Sea,** *Deep-sea research,* Mar./Apr. 1992 39(3/4A), p.537-547, 33 refs.

Vertical profiles of dissolved aluminum (Al) at 5 stations in the Weddell Sea are presented; concentrations range from 1 to 5 nM, considerably lower than Al levels in the Atlantic, typically in the 10-40 nM range, and similar to levels of 0.06-6 nM reported for the Pacific. The slight maximum in dissolved Al (4-5 nM) in the surface waters is suggested to be derived primarily from the partial dissolution of atmospheric dust. Minimum concentrations of dissolved Al (1-1.6 nM) are observed at intermediate depths (1500-3000 m). The slight increase in dissolved Al of about 2 nM with proximity to the sediment-water interface implies that sediments are not a significant source of dissolved Al to the deep waters. The combination of the low atmospheric input and the seasonally high rate of primary productivity that characterize the southern ocean can account for the low concentrations of dissolved Al in the Weddell Sea. The results reported in this study suggest that the low Al levels in the deep North Pacific can be explained by advection of low-Al source waters originating in the Weddell Sea. (Auth.)

Keir, R.S., **Effect of vertical nutrient redistribution on surface ocean *delta* C-13,** *Global biogeochemical cycles,* Dec. 1991 5(4), p.351-358, 31 refs.

Processes that shift nutrients from mid to lower ocean depths may or may not increase the ocean's vertical carbon pump. Redistribution of *delta* C-13 produced by these processes is compared in two box models: a vertical three-box ocean and a thirteen-box ocean. In the former there is no *delta* C-13 fractionation laterally between surface waters, and the ocean nutrient and *delta* C-13 distributions are linearly correlated. This correlation is not changed when these tracers become redistributed, and if the model surface ocean is nutrient limited, the surface *delta* C-13 cannot change. In the 13-box ocean there is a transfer of negative *delta* C-13 from the cold surface water through the atmosphere into the warm ocean. Its *delta* C-13 is therefore lower than it would be as a result of the carbon pump by itself. If a mid-depth nutrient depletion occurs because of lower nutrients in antarctic waters, the warm surface *delta* C-13 increases. If the vertical nutrient shift occurs because of ocean circulation or biological recycling changes, the warm surface water *delta* C-13 change depends on the ratio of its vertical CO2 fluxes, i.e., exchange of atmospheric CO2 versus upwelling total CO2 and net biological production. If this ratio remains about the same, then little change occurs in surface *delta* C-13, and the *delta* C-13 of Pacific deep water decreases about 0.3 per mill. In this case, no change in the average ocean *delta* C-13 is required to explain observations from sediment data. This would imply that the ice age land biota carbon mass was about the same as that of today. The vertical CO2 flux ratio could be an important consideration if greater wind-driven upwelling is a factor in the nutrient redistribution. (Auth.)

Bohrmann, G., Spiess, V., Hinze, H., Kuhn, G., **Reflector "Pc" a prominent feature in the Maud Rise sediment sequence (eastern Weddell Sea): occurrence, regional distribution and implications to silica diagenesis,** *Marine geology,* Apr. 1992 106(1/2), p.69-87, 29 refs.

Condensed pelagic deposits characterize the uppermost sediment sequence of the Maud Rise in the eastern Weddell Sea. The comparison of subbottom profiling data with the sediments drilled at two ODP sites shows that Lithologic Unit Ib deposited during late Miocene to late Pliocene times is generally characterized by acoustic transparency. A prominent reflector with strongly increased amplitude (called Reflector "Pc") occurs within this mainly homogeneous diatom ooze unit and is correlated with the porcellanite horizon found at ODP Site 689. As evidenced by sediment findings, Reflector "Pc" marks a distinct stratigraphic layer of early Pliocene age. The development of the Reflector "Pc" and its amplitude of reflection in the echosounding records is most likely caused by the silica cementation of porcellanite within this layer. In large areas of the central Maud Rise, a patchy but also continuous distribution of Reflector "Pc" was found. On average Reflector "Pc" is detected around 11 and 12 m below seafloor, but depth occurrence is highly variable within the range of 8 m to more than 18 m. The apparent amplitude of Reflector "Pc" is higher in those areas where the diatom ooze Unit Ib reaches greater thicknesses, which may be caused by local enhanced tectonic subsidence. In general a good correlation of Reflector "Pc" amplitude and thickness of lithologic Unit Ib is observed. (Auth. mod.)

Shemesh, A., Charles, C.D., Fairbanks, R.G., **Oxygen isotopes in biogenic silica: global changes in ocean temperature and isotopic composition,** *Science,* June 5, 1992 256(5062), p.1434-1436, 20 refs.

A record of oxygen isotopes in biogenic silica from a deep-sea sediment core from the southern ocean reveals that marine diatoms retain their primary isotopic composition after burial. As a result, the marine diatom record can be combined with data on coexisting planktonic foraminifera to monitor past surface temperature and isotopic composition of seawater. The coupling of these two records allows the solution of two paleotemperature equations for each core interval. Data from a South Atlantic core show that the average *delta* O-18 during the glacial period at this site was higher by about 1.3 per mill than average Holocene values, and that average glacial- age temperatures were not significantly different from average Holocene values. (Auth.)

Morrow, R., **Eddy momentum flux and its contribution to the southern ocean momentum balance,** *Nature,* June 11, 1992 357(6378), p.482-484, 24 refs.

A large amount of momentum is transferred to the southern ocean by strong westerly winds. Analytical and numerical models have suggested that transient eddies may be important in transporting this momentum away from the region of wind forcing, either horizontally or vertically downwards where it is balanced by bottom topographic drag. There are, however, few long-term *in situ* observations of horizontal eddy momentum flux, and no large-scale measurements of vertical eddy fluxes, to test these models. As a result, the momentum balance of the Antarctic Circumpolar Current (ACC) remains uncertain, and the role of eddies controversial. Geosat satellite altimeter data are used to resolve directional eddy kinetic energy and horizontal eddy momentum flux in the ACC on fine spatial and temporal scales. The complex spatial distribution of surface eddy momentum flux is strongly influenced by bottom topography. The horizontal eddy momentum flux tends generally to concentrate the mean flow, although some regions of divergence are observed. These results show that the zonally averaged horizontal eddy momentum flux from transient eddies is an order of magnitude too small, and in the wrong direction to directly balance the eastward momentum input from wind. (Auth. mod.)

Maamaatuaiahutapu, K., **Brazil-Malvinas Confluence: water mass composition,** *Journal of geophysical research,* June 15, 1992 97(C6), p.9493-9505, 23 refs.

A quantitative analysis of water masses in the Brazil-Malvinas Confluence zone is performed with a least squares multiple tracer analysis using data from the confluence winter 1989 cruise. The purpose is to find the mixture of source water types that best describes the composition of a given water sample. This method is valuable in regions involving strong mixing among various source water types, as in the Brazil-Malvinas Confluence zone. Seven main core layers are identified in this region, and all are retained for the analysis: the Thermocline Water (TW), the Subantarctic Surface Water, the Antarctic Intermediate Water (AAIW), the Upper Circumpolar Deep Water, the North Atlantic Deep Water (NADW), the Lower Circumpolar Deep Water, and the Weddell Sea Deep Water. Tracers selected are temperature, salinity, dissolved nutrients, and oxygen. The results show the proportion of each source water type along four east-west sections (35.4S, 36.5S, 37.9S, 39S). They are accurate to within 20% for all sources. The solution presents evidence of local recirculation of AAIW, largely influenced by the two strong currents, Brazil and Malvinas. Southward TW and NADW separate from the coast, with NADW turning eastward at a higher latitude than TW. (Auth.)

Medina, F., **Ocean currents in Discovery Bay** [Estudio de corrientes marinas en la Bahía Chile (Bahía Discovery)], *Acta antártica ecuatoriana,* 1990 Vol.1, p.1-11, In Spanish with English summary. 6 refs.

Surface water velocities have been measured in Chile Bay as part of the Second Ecuadorian Antarctic Scientific Expedition, during the southern summer, 1990. Drifting ice floes broken from shore were used as a Lagrangian tracer. Surface currents and wind observations are compared. Surface circulation is determined by winds, when the wind speed is higher than 6 m/s. Maximum values and direction of the surface drift current depend exclusively upon the prevailing wind field. Current speed may reach up to 40 cm/s. (Auth.)

Pudsey, C.J., **Late Quaternary changes in Antarctic Bottom Water velocity inferred from sediment grain size in the northern Weddell Sea,** *Marine geology,* June 1992 107(1/2), p.9-33, Refs. p.31-33.

Newly formed bottom water (theta -0.7 C) in the northern Weddell Sea flows E or NE at speeds up to 10-15 cm/s, with velocity decreasing towards the center of the Weddell Gyre. Upper Quaternary sediments from this area contain a fine-grained terrigenous component plus biogenic silica with a small amount of ice-rafted debris. In cores from between 61 and 66S and from 3300 m to 4700 m water depth, the proportion of biogenic silica increases northwards, and the proportion of silt and well-sorted fine sand in surface sediments increases with average current velocity. Downcore, diatom-rich and diatom-poor sediments alternate on a scale of 1-3 m, and intervals with more diatoms contain a higher proportion of silt to clay. Preliminary stratigraphy suggests that the cyclicity in composition and texture is related to glacial-interglacial cyclicity. During warm periods, biogenic silica production takes place during several months of each year, and silt and fine sand are transported by bottom currents. During glacial periods with greater sea-ice cover than at present, biogenic productivity was suppressed and no silica was preserved in the sediments; in addition, a lower proportion of terrigenous silt implies that bottom currents were weaker. At sites with a present-day average velocity of 10 cm/s, a Last Glacial Maximum average velocity of 1 cm/s or less is inferred from grain-size measurements. (Auth. mod.)

Nelson, D.M., Tréguer, P., **Role of silicon as a limiting nutrient to antarctic diatoms: evidence from kinetic studies in the Ross Sea ice-edge zone,** *Marine ecology progress series,* Mar. 1992 80(2-3), p.255-264, 48 refs.

During the austral summer of 1990 an intense diatom-dominated, ice-edge phytoplankton bloom in the southwestern Ross Sea resulted in depletion of silicic acid, nitrate and phosphate to concentrations much lower than is typical for antarctic surface waters. Silicic acid was depleted to <6 microM within the core of the meltwater field, where biogenic particulate silica concentrations exceeded 20 micromol/l. Three Si uptake kinetic experiments were conducted on natural phytoplankton assemblages from the nutrient-depleted zone; Si30-labeled Si(OH)4 was used to measure the uptake rate at concentrations ranging from 1 to 20 microM above ambient. Dependence of the specific uptake rate on silicic acid concentration conformed well to a Michaelis-Menten saturation model; maximum uptake rates ranged from 0.0022 to 0.0028/h which corresponds to maximum growth rates of 0.08 to 0.10 doublings/d. Half-saturation constants ranged from 1.1 to 4.6 microM, a range similar to values found in other areas of the ocean and considerably lower than those previously reported for several antarctic diatom species in culture studies. Results indicate detectable but weak substrate limitation of silicic acid uptake rate by the naturally occurring diatom assemblage in the western Ross Sea. Significant Si limitation in other subsystems of the southern ocean would be possible only if their resident diatom assemblages had much lower affinity for silicic acid than the authors observed. England, M.H., **On the formation of Antarctic Intermediate and Bottom Water in ocean general circulation models,** *Journal of physical oceanography,* Aug. 1992 22(8), p.918-926, 28 refs.

A series of coarse-resolution models were integrated with a view to determining the most appropriate representation of the largest-scale water masses formed in the southern ocean. In particular, it was hoped that the models could realistically simulate Antarctic Bottom and Intermediate Water. The ocean model employed has a global domain with a realistic approximation of the continental outlines and bottom bathymetry. The subgrid-scale variation of bottom bathymetry is removed by spatial averaging over each grid box. The annual mean forcing at the sea surface is derived from climatological fields of temperature, salinity, and wind stress. It is found that the salinity of shelf water in the Weddell and Ross Seas is critical if the model is to appropriately simulate the world's intermediate and bottom water masses. It is suggested that the sea-ice component of climate models is critical if the simulation is to capture the high-salinity shelf water and bottom-water formation adjacent to Antarctica and, in turn, allow for a realistic tongue of low-salinity Antarctic Intermediate Water (AAIW). The bathymetry of the Drake Passage is shown to determine the shape and strength of an intense meridional overturning cell in the southern ocean. By properly representing the northward extent of the Drake Passage, the formation and equatorward spreading of AAIW is simulated realistically. The scheme of AAIW formation obtained is quite different from the classical notion of circumpolar subduction of surface water at the polar front. (Auth. mod.)

Cheng, X.H., Zhang, H.S., Xia, W.P., **Anomaly of fluorine in a sedimentary system, western antarctic ocean,** *Antarctic research,* Dec. 1991 2(2), p.59-67, 13 refs.

Fluorine content in bulk sediment and its pore water in the western antarctic ocean is 200-395 micrograms/g and 1.8-1.92 micrograms/ml respectively, far below the average reported previously in the world oceans (540 micrograms/g and 2.7 micrograms/ml, respectively). This study also shows that the distribution of fluorine in the sediments of the area is mainly controlled by the chemical composition of the material from the surrounding islands, and the element seems to be mostly incorporated in hornblende. The correlation between the fluorine and the hornblende amount in the sediments can be expressed statistically as follows: $F=217+\ln Vh$. The low concentration of fluorine in the pore water is largely due to the weak weathering process on the islands and the precipitation of the element with calcium. (Auth. mod.)

Li, F.R., **Preliminary study of the oxygen-minimum layer in water area adjacent to South Shetland Islands and north of Ardley Island, Antarctica, in summer,** *Antarctic research,* Dec. 1991 2(2), p.68-74, 5 refs.

The vertical distribution of oxygen in the oxygen-minimum layer in waters adjacent to the South Shetland Is. and north of Ardley I. in summer has the following features: the depth at which the oxygen content greatly decreases coincides with the depth of the pycnocline; there is a thick water layer with low oxygen content; and the oxygen-minimum layer occurs below the thermocline and coincides with the depth at which the temperature increases the most. According to preliminary results of correlation analysis, the variation of the oxygen-minimum layer is related to the physical properties of the circulation and the biochemical process in the deep layer of the ocean. Noh, I., **Algal pigments and their degradation products in southern ocean and Gulf of Mexico surface waters,** College Station, Texas A and M University, 1991, 143p., University Microfilms order No. 92-16986, Ph.D. thesis. Refs. p.125.137.

Photosynthetic pigments and their degradation products in suspended and sinking particles collected from the southern ocean and NW Gulf of Mexico surface waters were measured using High Performance Liquid Chromatography (HPLC). The short- term variations in flux rates of chlorophylls and carotenoid pigments, as well as their degradation products, were compared at several locations in Prydz Bay during summer 1987-88. Chlorophyll *a* accounted for approximately half of the pigments measured. A series of 5 phaeophorbide *a* derivatives, which are probably produced by zooplankton grazing, were the dominant degradation products in porphyrins. Among the carotenoid pigments, fucoxanthin dominated in both water column and sediment trap samples. Pigment data confirm the observations of Kang (1989) that diatoms were the dominant component of the Prydz Bay phytoplankton community. The flux rate of chlorophyll *a* at Outer Prydz Bay sites was generally highest at 50 m, and approximately double the flux rates at deeper horizons; however, at Inner Bay sites, the mean flux rate of chlorophyll *a* at 200 m was 4 times higher than that at 50 m. Such anomalously high fluxes at 200 m imply that grazers were locally abundant between 100 m and 200 m at these sites closest to land, and this hypothesis is supported by visual evidence of lots of fecal pellets in the 200 m trap. Turnover rates for algal pigments in Prydz Bay, computed as standing stocks divided by measured flux, were negligible. Thus, suspended particulate material in Prydz Bay was not recycled rapidly. (Auth. mod.)

Johnson, T.J., Stewart, R.H., Shum, C.K., Tapley, B.D., **Distribution of Reynolds number stress carried by mesoscale variability in the Antarctic Circumpolar Current,** *Geophysical research letters,* June 19, 1992 19(12), p.1201-1204, 21 refs.

Satellite altimeter data collected by the U.S. Navy's Geosat Exact Repeat Mission were used to investigate turbulent stress resulting from the variability of surface geostrophic currents in the Antarctic Circumpolar Current. The altimeter measured sea level along the subsatellite track. The variability of the along-track slope of sea level is directly proportional to the variability of surface geostrophic currents in the cross-track direction. The two components of the slope were used at points where the satellite ground tracks cross to calculate orthogonal components of the current's variability. Two and a half years of data were used to compute the statistical structure of the variability, leading to a better understanding of the role of variability in the dynamics of the current. The statistics included the probability distribution functions for each component of the current, the time-lagged autocorrelation functions of the variability, and the Reynolds stress produced by the variability. The results demonstrate that stress is correlated with bathymetry. In some areas the distribution of negative stress indicates that eddies contribute to an acceleration of the mean flow, strengthening the hypothesis that baroclinic instability makes important contributions to strong oceanic currents. Dixon, J.E., **Circulation processes in Lapeyrère Bay, Anvers Island, Antarctica, and implications in the event of petroleum pollution,** Clinton, Hamilton College, 1991, 54p., 14 refs.

The focus of this paper is on the surface circulation processes in Lapeyrère Bay, a fjord on Anvers I. Data were collected during the summer melt season in Dec. 1987 and Jan. 1988. Meltwater from the surrounding glaciers, when present, was not found to play a large role in circulation. In contrast, iceberg melt affected surface temperatures and salinity by as much as 1 C and 1.2 ppt. in the upper 15 m of the water column. Using criteria developed by Shen, Yapa and Petroski and others, the author found that an oil spill in a sub-polar fjord such as Lapeyrère Bay could have potentially devastating effects, since the rate of spreading and chemical and biological degradation are strongly influenced by the season, weather, and amount of ice in the fjord. Kawamiya, M., Nagata, Y., Michida, Y., Odamaki, M., **Seasonal sea-level variation at Syowa Station,** International Symposium on Okhotsk Sea and Sea Ice, 7th, Mombetsu, Hokkaido, Japan, Feb. 2-5, 1992. Abstracts, Mombetsu, Okhotsk Sea and Cold Ocean Research Association, 1992, p.165-169, 5 refs.

Sea level was measured at Showa Station from 1979 through 1988. The range of the seasonal variation averages about 26 cm, with the highest level in early winter and the lowest level in mid summer. Contributing factors to the higher sea level in winter may include decreases in salinity and density in the surface layers as the heavier saltier water sinks to the bottom, and increases in the coastal current and wind velocities, with katabatic winds being the major factor.

Dafner, E.V., **Dissolved organic carbon in waters of the Polar Frontal Zone of the Atlantic Antarctic in the spring-summer season of 1988-1989,** *Marine chemistry,* Apr. 1992 37(3-4), p.275-283, 13 refs.

Samples were collected and preserved for onshore measurement of dissolved organic carbon (DOC) in the area extending over the Polar Frontal Zone (PFZ) in Sep.-Dec. 1988. The highest concentrations of DOC were found in the pycnocline layer near the southern boundary of the PFZ and in dynamically active areas, such as meanders and mesoscale eddies, where the DOC concentrations amounted to 6-8 mg/l. To the north and south of the PFZ, concentration of DOC diminished considerably, as a result of less intensive processes of organic matter production. (Auth.)

Trumbore, S.E., Jacobs, S.S., Smethie, W.M., Jr., **Chlorofluorocarbon evidence for rapid ventilation of the Ross Sea,** *Deep-sea research,* 1991 38(7), p.845-870, Refs. p.868-870.

In 1984, concentrations of CFC-12 and CFC-11 in Ross Sea continental shelf water averaged nearly half that of saturated surface water. Circumpolar Deep Water within 50 km of the Ross Sea continental shelf also contained measurable CFC-12 and CFC-11, but an order of magnitude less than shelf waters. CFC-12 and CFC-11 concentrations in the deep water overlying the continental slope increased with depth, indicating recent ventilation and bottom water formation near the continental shelf. Several water masses on the continental shelf that are commonly distinguished on the basis of temperature and salinity characteristics also varied in CFC content, and thus in their modes and rates of ventilation and renewal. A time-dependent model reproducing the 1984 sub-surface shelf water CFC concentrations demonstrates the relative importance of mixed layer entrainment, gas exchange through leads in the winter sea ice field, and mixing with source waters derived from the Circumpolar Deep Water. Model results show that mixed layer entrainment at the beginning of winter is the dominant process for ventilating sub-surface shelf water in the eastern Ross Sea, while western shelf waters also require significant gas exchange during winter. Cheng, X.H., Xia, W.P., Zhang, H.S., Lu, Y.L., **Early diagenesis and biogeochemistry of iodine in west antarctic ocean,** *Oceanologia et limnologia sinica,* Mar. 1992 23(2), p.115-123, In Chinese with English summary. 14 refs.

During the First Chinese Antarctic Ocean Exploration from Dec. 1984 to Feb. 1985, 27 grab samples and 2 box samples were obtained. With tracing to the diagenetic distribution of iodine, some records relative to the reversible processes of early diagenesis and biogeochemistry of iodine are obtained. The distribution of iodine depends on biogenic materials, and thus the regeneration of bioiodine mainly occurs in early diagenesis. Furthermore, its regeneration process is closely correlated with the release of sedimentary organic nitrogen. The estimated rate of iodine regeneration is 0.023 micrograms/g/yr on average. The diffusion fluxes of iodine returned to the aquatic biogeochemical system ranged from F=0.58 picogram/sq cm/sec to F=0.083 picogram/sq cm/sec. It shows potential significant effects of pH, carbonate balance and redox conditions on the regeneration release of bioiodine; both basic and reductive conditions will facilitate the release of iodine from sediments in an early diagenetic environment. Stocchino, C., Lusetti, C., **Tide characteristics in Terra Nova Bay** [Nuove osservazioni sulle caratteristiche della marea a Baia Terra Nova (Mare di Ross—Antartide)], Genoa, Istituto Idrografico della Marina, 1991, 21p., In Italian with English summary. 3 refs.

This paper presents the results of an analysis of two tide recordings carried out at Terra Nova Bay during the 4th and 5th Italian antarctic expeditions in 1988-89 and 1989-90, respectively. Using the Doodson method, two new series of tidal harmonic constants were computed, also defining their mean values with due consideration of earlier calculations (Stocchino and Lusetti, 1988). The most significant items of concordance are hereby evidenced. In particular, the diurnal character of such tide was confirmed, and characteristic data on the local variations of the sea-level were evaluated. (Auth.)

Stocchino, C., Lusetti, C., **Hydrology and dynamics of Terra Nova Bay** [Prime osservazioni sulle caratteristiche idrologiche e dinamiche di Baia Terra Nova (Mare di Ross—Antartide)], Genoa, Istituto Idrografico della Marina, 1990, 55p., In Italian with English summary. 20 refs.

The hydrologic situation of a zone in Terra Nova Bay has been examined, in particular the behavior of isotherms and isohalines, at 0, 50, 100 and 300 m depths. TS diagrams and stability profiles were obtained. A study of the dynamic topographies relative to the 300 m depth is also discussed. The results show a stable situation and the TS curves show an almost rectilinear behavior. The dynamic topographies show a current behavior that seems to indicate a significant difference between the surface and the deeper layers. (Auth. mod.)

Stocchino, C., Lusetti, C., **Harmonic tide constants of Terra Nova Bay** [Le costanti armoniche di marea di Baia Terra Nova (Mare di Ross—Antartide)], Genoa, Istituto Idrografico della Marina, 1988, 23p., In Italian with English summary. 10 refs.

The harmonic tide constants of Terra Nova Bay, calculated from two records of 49 and 36 days, are presented. The analysis is performed by using Doodson's method after the elimination from the first record of two gaps of data by the maximum entropy method. After some consideration about the reliability of the data, a set of harmonic constants is obtained. A good agreement between observed and calculated data is found. The behavior of the tide is diurnal, in agreement with the results of other authors.

Stocchino, C., Manzella, G.M.R., **Analysis of currents in Terra Nova Bay** [Analisi delle correnti marine di Baia Terra Nova (Mare di Ross—Antartide)], Genoa, Consiglio Nazionale delle Ricerche, 1991, 56p., In Italian with English summary. 8 refs.

Hydrological and current measurements were carried out in Terra Nova Bay; the data permitted the definition and distribution of water masses. The coastal area was characterized by the presence of warmer and more saline water, attributed to the effects of katabatic winds producing an eastward advection of the newly formed ice, the presence of the Drygalski Ice Tongue preventing the northward drift of the ice. The circulation was characterized by large scale vortices whose signals were detected by both CTD and current meters. At the surface, the circulation was driven by local forcing; advective movements were detected at depth. The spatial and temporal variability was very high. Periodicity is related to diurnal tides of 5-day-fluctuation periods attributed to atmospheric forcings. (Auth.)

Matsuda, O., Kawaguchi, K., Ishikawa, S., Nagahama, M., **Seasonal variation in particulate organic matter under the antarctic fast ice with special reference to C:N:P ratio and phytoplankton activity. (Extended abstract),** NIPR Symposium on Polar Biology, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.168-170, 5 refs.

From the viewpoint that the seasonal variation of organic matter plays an important role in the energy flow and food availability in the ecosystem under ice, a year-round observation on particulate organic matter was carried out from Feb. 1984 to Jan. 1985 at 3 stations in the Kita-no-ura cove off East Ongul I., Lützow-Holm Bay, during the 25th Japanese Antarctic Research Expedition. Seasonal variations in particulate organic carbon, particulate organic nitrogen and particulate phosphorus were monitored with special reference to the C:N:P ratio and chlorophyll *a* standing stock. Marked seasonal variations of particulate matter, particularly chlorophyll *a,* were observed in the surface water. The concentration of particulate matter was generally high in summer, especially in the surface water, but low in winter.

Lutjeharms, J.R.E., **Oceanography and fish distribution of the southern ocean,** Fishes of the southern ocean, edited by O. Gon and P.C. Heemstra, Grahamstown, South Africa, J.L.B. Smith Institute of Ichthyology, 1990, p.6-27.

DLC QL637.2 F57 1990

The southern ocean has some unique characteristics as a major component of the world ocean. Amongst these are the near-circular symmetry of most of its physical and chemical characteristics, the immense expanse of cold surface water, globally by far the largest, as well as the most pronounced seasonal variation at the sea surface of any comparable ocean basin. Clearly, the distribution of these physical and chemical variables in space and time should also be reflected in the distribution patterns of biological organisms, especially the fishes. It is the purpose of this chapter to describe in general terms what is known about the physical properties and processes in the southern ocean that may influence the creation of specific biogeographical boundaries and habitats. In order to identify those physical variables, complexes of variables, or dynamic processes that may be particularly implicated in southern ocean biogeography, it is necessary to establish briefly what is presently known about oceanic biogeography in general and about southern ocean ichthyogeography in particular. (Auth.)

Capella, J.E., **Circulation and temperature effects on the development and distribution of the eggs and larvae of the antarctic krill *Euphausia superba:* A modeling study,** College Station, Texas A and M University, 1989, 162p, University Microfilms order No. 90-15466, Ph.D. thesis. Refs. p.153-161.

An existing three-dimensional time-dependent circulation model was adapted to investigate the circulation in the South Shetland Is.—Bransfield Strait region. The simulated circulation distributions show seasonal variability in the upper 150 m. A second time- and temperature-dependent model was developed to simulate the descent-ascent behavior of the eggs and larvae of *Euphausia superba.* The two models were combined in a Lagrangian particle tracing model to simulate the trajectories of the krill eggs and larvae. The Lagrangian trajectories show that most of the horizontal transport of the egg-larva particles occurs after the larva has reached the surface. Trajectories of eggs released north of the South Shetland Is. and east of Livingston I. are westward. Eggs released north of Snow I. are transported into Drake Passage. Krill larvae are transported into the Bransfield Strait from the Bellingshausen and Weddell Seas. The Lagrangian trajectories show that eggs released north of the South Shetland Is. complete their development faster than eggs released in Bransfield Strait or east of the Antarctic Peninsula; the surface flow is the primary factor influencing the egg-larva trajectories; and the timing of the krill spawning has a significant effect on the eventual position of the feeding larvae. (Auth. mod.)

Stott, L.D., **Antarctic paleoceanography,** Kingston, University of Rhode Island, 1989, 393p., University Microfilms order No. 90-08850, Ph.D. thesis. Refs. p.370-393.

The Paleogene paleoceanography of the Weddell Sea was studied using calcareous biogenic sequences from Maud Rise. A new planktonic foraminiferal biostratigraphy has been developed for the Paleogene which has been calibrated to magnetostratigraphy. The Paleogene thermal structure of the seasonal thermocline was investigated for the Paleogene, using information derived from the isotopic composition of planktonic foraminifera. The results indicate that a well-developed thermocline existed in the Antarctic during the early Paleogene, but was progressively reduced in thickness and possibly seasonal duration during the late Paleogene. Benthic foraminiferal isotopic composition during the Paleogene from two sites located at different depths on Maud Rise provide evidence of a multilayered Paleogene ocean. This is possibly the first evidence for warm saline bottom waters for the Cenozoic. The Cretaceous/Tertiary boundary was analyzed using the isotopic composition of multiple species of benthic and planktonic foraminifera. Evidence of a significant climatic cooling is recorded in the isotopic compositions of planktonic and benthic foraminifera from the last 200 Kyrs of the Cretaceous, suggesting the marine environment was undergoing considerable change prior to the mass extinction at the K/T boundary. Minas, H.J., Minas, M., **Net community production in "High nutrient-low chlorophyll" waters of the tropical and antarctic oceans: grazing *vs* iron hypothesis,** *Oceanologica acta,* 1992 15(2), p.145-162, With French summary. 84 refs.

A study comparing HNLC waters in tropical and antarctic regions is described, and antarctic nutrient consumption diagrams are presented. An overall consumption evaluation along a 1,550 km north-south section leads to atomic assimilation ratios of *delta*Si/*delta* N/*delta*P=55.9/12.3/1. From the end of winter to end of summer, the average nitrate consumption is 0.38 mol/sq m. For this five month period, the calculated NP is 0.2 g C/sq m/d. From the silicon-nitrogen ratios during nutrient consumption and those in the particulate material, the authors deduce an *f*-ratio slightly lower than 0.5. This *f* value confirms earlier data derived from N-15 uptake studies. The model application leads to a Vmax (TP) value of 0.54/d, which does not seem excessively low in the low temperature regime of the southern ocean. An antarctic scenario is discussed starting with "grazing" limitation and finishing with iron limitation. Despite evidence in favor of the grazing hypothesis which allows one to classify regions geographically into "high and low" speed areas of phytoplankton development, a global chart of dust inputs into the ocean strongly supports the iron limitation hypothesis. This observation constitutes a challenge to the "grazing only" hypothesis, and militates in favor of more detailed future studies. (Auth. mod.)

Capella, J.E., Ross, R.M., Quetin, L.B., Hofmann, E.E., **Note on the thermal structure of the upper ocean in the Bransfield Strait-South Shetland Islands region,** *Deep-sea research,* Jul./Aug. 1992 39(7/8), p.1221-1229, 12 refs.

Sixteen XBT sections were occupied from Dec. 1982 to July 1987 in and around the Bransfield Strait and the South Shetland Is. These and other temperature data from the FDRAKE75, FDRAKE76 and DRAKE79 field programs provide a description of the temperature structure and water mass distribution of the upper 500 m in this region. Temperature distributions at 300 and 500 m show Circumpolar Deep Water (>0 C) north of the South Shetland Is., which enters Bransfield Strait through a gap between Smith and Snow Is. Inside the Strait this water is confined to a narrow band along the southern flank of the Islands. The fine spatial resolution of the XBT sections shows a sharp thermal gradient between the cold (<0 C) Bransfield Strait waters and the warmer (>0 C) waters of Drake Passage origin. The presence of cold Bransfield Strait waters over the northeast portion of the Island slope region is related to north-south motions of this temperature boundary. The Polar Slope Current, on the northern side of the South Shetland Is., appears as a tongue of cold (<0 C) water that extends westward from Elephant I. to the gap between Smith and Snow Is. (Auth.)

Pichon, J.J., **Surface water temperature changes in the high latitudes of the Southern Hemisphere over the last glacial- interglacial cycle,** *Paleoceanography,* June 1992 7(3), p.289-318, Refs. p.316-318.

A set of numerical equations is developed to estimate past sea surface temperatures (SST) from fossil antarctic diatoms. These equations take into account both the biogeographic distribution and experimentally derived silica dissolution. The data represent a revision and expansion of a floral data base used previously, and include samples resulting from progressive opal dissolution experiments. Factor analysis of 166 samples (124 Holocene core top and 42 artificial samples) resolved four factors. Three of these factors depend on the water mass distribution (one subantarctic and two antarctic assemblages); factor 4 corresponds to a "dissolution assemblage". Inclusion of this factor in the data analysis minimizes the effect of opal dissolution on the assemblages and gives accurate estimates of SST over a wide range of biosiliceous dissolution. The reconstructed SST records present strong analogies with the air temperature record over Antarctica at the Vostok site, derived from changes in the isotopic ratio of the ice. This similarity may be used to compare the oceanic isotope stratigraphy and the Vostok time scale derived from an ice flow model. The oceanic time scale, if taken at face value, would indicate that large changes in ice accumulation rates occurred between warm and cold periods. (Auth. mod.)

Sharma, G.S., Peter, B.N., **Entrainment of circumpolar water in the Indian Ocean region of the Antarctic,** *Indian Academy of Sciences. Proceedings. Earth and planetary sciences,* Mar. 1990 99(1), p.425-438, 21 refs.

DLC QE1.P733

The net influx of the circumpolar water on the western (approximately along 10E) and eastern (approximately 115E) boundaries of the Indian Ocean, adopting the method of Montgomery and Stroup, is computed on bivariate distribution of potential thermosteric anomaly and salinity to identify the characteristics of the flux. The zonal flux at both the boundaries indicates an alternate strong easterly and westerly flow between 36S and 45S, south of which the flow is mainly easterly but weak up to 56S. At the western boundary the easterly flow is 146 Sv and westerly is 98.07 Sv, while at the eastern boundary (115E) the corresponding fluxes are 123.46 Sv and 27.20 Sv, respectively, indicating a net outflux of 48.33 Sv. Park, Y.H., **Satellite evidence of semiannual baroclinic Rossby waves in the Indian Ocean** [Mise en évidence d'ondes planétaires semi-annuelles baroclines au Sud de l'Océan Indien par altimétre satellitaire], *Académie des sciences, Paris. Comptes rendus. Série II,* Mar 29, 1990 310(7), p.919-926, In French with abridged English version. 3 refs.

Meso-scale planetary waves in the Crozet basin in the Indian Ocean have been detected and studied by two-dimensional spectral analysis of sea level variability deduced from GEOSAT satellite altimeter measurements. The maximum energy of these westward propagating waves is strongly concentrated in periods about 6 months and wavelengths of 300 to 600 km with phase speeds of 2 to 4 cm/s. These spectral characteristics are consistent with those of baroclinic Rossby waves modified by the bottom topography of the basin. (Auth.)

Dehairs, F., Baeyens, W., Goeyens, L., **Accumulation of suspended barite at mesopelagic depths and export production in the southern ocean,** *Science,* Nov. 20, 1992 258(5086), p.1332-1335, 33 refs.

The relation between the accumulation of barite (BaSO4) microcrystals in suspended matter from the mesopelagic depth region (100 to 600 m) and the type of production in the euphotic layer (new versus recycled) was studied for different southern ocean environments. Considerable subsurface barite accumulated in waters characterized by maintained new production and limited grazing pressure during the growth season. On the other hand, little if any barite accumulated in areas where relatively large amounts of photosynthetically fixed carbon were transferred to the microheterotrophic community and where recycled production became predominant. Howard, W.R., Prell, W.L., **Late Quaternary surface circulation of the southern Indian Ocean and its relationship to orbital variations,** *Paleoceanography,* Feb.1992 7(1), p.79-117, Refs. p.113-117.

The paleoceanographic history of the southern Indian Ocean is reflected by the movement of two prominent dynamical features of the southern ocean: the Subtropical Convergence (STC) and the Antarctic Polar Front (APF). These fronts, and their associated sea surface temperature (SST) signatures, are well delineated by planktonic foraminiferal faunas in surface sediments of the southern Indian Ocean. Using a transect of piston cores between 42S and 48S at about 90E, the latitudinal distribution of planktonic foraminiferal faunas over the past 500,000 years has been reconstructed. Time series analyses of the SST records in this transect reveal statistically significant concentrations of variance in the primary orbital frequency bands. SST variations in these bands are coherent with orbital variations and with changes in *delta*O-18. SST in the subantarctic Indian Ocean slightly precedes changes in *delta*O-18 occurring in the eccentricity, obliquity, and precession bands, and lag orbital variations in the obliquity and precession bands. These results place important constraints on possible mechanisms of interhemispheric climatic timing. The similarities in temporal patterns and timing among southern ocean SST, atmospheric CO2, and relative flux of North Atlantic Deep Water implicate atmospheric carbon dioxide and deep water circulation as possible interhemispheric pacing mechanisms. (Auth. mod.)

Chipman, D.W., Takahashi, T., Breger, D., Sutherland, S.C., **Investigation of carbon dioxide in the South Atlantic and northern Weddell Sea areas (WOCE Sections A-12 and A-21) during the METEOR expedition 11/5, January-March 1990,** *U.S. Department of Energy. Final technical report,* Dec. 1991 DOE/ER/60943—1, 111p., DE92 010027, 25 refs.

This report summarizes the results of investigations during the oceanographic expedition aboard the F/S *Meteor* in the South Atlantic Ocean including the Drake Passage, the northern Weddell Sea and the eastern South Atlantic during the summer of 1990. The total CO2 concentration in about 1300 seawater samples and CO2 partial pressure (pCO2) in about 870 seawater samples collected at 77 stations were determined aboard the ship using a coulometer and equilibrator/gas chromatograph system. The temperature, salinity, dissolved oxygen and nutrient salt data presented in this report were determined by other participants of the expedition including the members of the Oceanographic Data Facility of the Scripps Institution of Oceanography, Argentine Hydrographic Office and German institutions. (Auth. mod.)

Frew, R.D., Hunter, K.A, **Influence of southern ocean waters on the cadmium-phosphate properties of the global ocean,** *Nature,* Nov. 12, 1992 360(6400), p.144-146, 14 refs.

Measurements of the cadmium content of marine CaCo3 deposits, such as aragonitic corals and foraminiferal shells, have been used to trace past ocean circulation and as an indicator of labile nutrient concentrations. In particular, studies of foraminiferal cadmium have provided insight into the oceanic processes controlling atmospheric CO2 concentration in glacial times. The use of Cd/Ca ratios as a labile nutrient indicator is made possible by a relationship between seawater cadmium and phosphate content that is remarkably uniform throughout the present ocean. Recent data of cadmium and phosphate in southern ocean waters are presented. They suggest that a break in this uniformity is created by the input of Cd-depleted subantarctic waters into the intermediate waters of the global ocean.

McTaggert, A.R., Burton, H., **Dimethyl sulfide concentrations in the surface waters of the Australasian antarctic and subantarctic oceans during an austral summer,** *Journal of geophysical research,* Sep. 15, 1992 97(C9), p.14,407-14,412, 39 refs.

Dimethyl sulfide (DMS) was measured in surface seawater samples collected between Tasmania and Antarctica in the Australasian sector of the southern ocean during the 1988-1989 austral summer. The mean DMS concentration in subantarctic waters for January was 20.5 nmol/L decreasing to 4.0 nmol/L in the Antarctic Convergence. During December and January the Australasian Antarctic Divergence appears to be an area of high primary productivity as the concentration of DMS in these surface waters remained relatively constant at 18.5 nmol/L. Samples collected on the shelf and in coastal waters of Prydz Bay, East Antarctica, show a distinct rise in DMS concentration on all voyages with a maximum concentration of 122 nmol/L recorded in January near Davis. Brehme, I., **Sediment facies and bottom water current on the continental slope in the northwestern Weddell Sea** [Sedimentfazies und Bodenwasserstrom am Kontinentalhang des nordwestlichen Weddellmeeres], *Berichte zur Polarforschung,* 1992 No.110, 127p., In German with English summary. Refs. p.74-83.

Geologic cores on two profiles oriented normal to the continental shelf and slope have been investigated to reconstruct the Quaternary sedimentary history of the southeast continental border of the South Orkneys (NW Weddell Sea). The sediments are described macroscopically and their fabric investigated by use of X-radiographs. Laboratory work comprised detailed grain-size analysis, determination of the water content, carbonate, organic carbon and sand fraction composition. Stable oxygen and carbon isotopes were measured on planktonic foraminifera. Palaeomagnetism, analysis of Th-230 content, and detailed comparison of the lithologic parameters with the oxygen isotope stages (Martinson curve) were used for stratigraphic classification of the sediments. (Auth. mod.)

Sen, A.K., Mitra, A., Karmakar, P.K., Datta, A.K., **Estimate of millimeter wave propagation in polar region,** International Geoscience and Remote Sensing Symposium (IGARSS '90), College Park, MD, May 20-24, 1990. Digest, Vol.2. Remote sensing science for the nineties, New York, Institute of Electrical and Electronics Engineers, Inc., 1990, p.1547-1550, 5 refs.

To realize the broad band capability of millimeter waves in the vertical and horizontal path in the polar regions, a comprehensive study was undertaken in Antarctica concentrating on the propagation parameters at approximately 44/30 GHz and 94 GHz respectively. For the vertical path the positional dependence of the orbiting satellite and the geostationary satellite were considered. Accounting for the propagation parameters, the corresponding Tx and Rx configurations have been suggested for the LOS link and satellite link. (Auth. mod.)

Barrow, C.H., Watermann, J., Evans, D.S., Wilhelm, K., **Observations of antarctic auroral electron precipitation with high stability in time and longitude,** *Annales geophysicae,* Apr. 1991 9(4), p.259-266, 12 refs.

Electron flux measurements were made in the energy range 0.1 to 12.5 keV by the electron spectrometer 1ES019 on board Spacelab 1, during the period Nov. 29 to Dec. 7, 1983. The spacecraft was in a 57 deg inclination circular orbit at an altitude of about 250 km with an orbital period of 90 min. Although the experiment was originally designed for artificial electron beam response observations, several periods of natural energetic electron precipitation were also recorded, and these have been surveyed and catalogued. On Nov. 30, 1983 Spacelab 1 observed electron precipitation during four successive Southern Hemisphere passes, one of which is of particular interest as the NOAA-7 satellite, which measured electron flux in the energy range 0.3 to 20 keV at an altitude of about 850 km, was then quite close in space and time. As correlative riometer and magnetometer observations suggest that auroral conditions remained stable during the 25-min period between the two sets of observations, the observations are used to infer the gross spatial structure of the auroral precipitation over the midnight sector. Comparison of the electron energy spectra observed by Spacelab 1 and NOAA-7 at different magnetic local times and at different altitudes suggests a high degree of longitudinal homogeneity in the precipitation. (Auth. mod.)

Cazeneuve, H., Grinspon, M., **Linear transformations in the polar upper atmosphere** [Transformaciones lineales en la alta atmosfera polar], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1991 No.389, 18p., In Spanish with English summary. 9 refs.

The functions of spectral coherency and power transfer between time series have been estimated by using data from 7 antarctic stations. A linear association between the time series of some pairs of stations is found to persist during several active periods. The natural interpretation is that a linear transformation acts upon the primary source of perturbation, thus the signals received at one station are a filtered version of the signals received at the other one that forms the pair. The power spectra contain incoherent portions that can be attributed to the superposition of contributions from different sources, which introduces non-linearities in the spectral results. The persistent spectral response and the linear association between pairs of stations seems to reveal some characteristic property of the polar upper atmosphere. (Auth.)

Cazeneuve, H., Grinspon, M., **Collective response from various antarctic stations** [Respuesta colectiva en varias estaciones antárticas], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1991 No.379, 22p., In Spanish with English, French and German summaries. 14 refs.

To find evidence of an ordered structure in geomagnetic variations, data from 6 antarctic stations were analyzed. Results from interspectral and cross-correlation analysis provide conclusive evidence of a collective response from the stations when magnetic activity is excited. Conditions of linearity of the coherency analysis indicate that over an extended area of Antarctica a similar energy distribution is effective during disturbed conditions. This area should be homogeneously disturbed, producing a highly correlated and spatially coherent pattern of activity at the stations involved. The interspectral analysis provides a further characterization of the medium in which the signals propagate, since some bands of frequency with a high coherency can be considered an invariant characteristic of the medium, as they persist over prolonged periods. (Auth.)

Recabarren, P.G., Calderon, J.H., Lombardo, M.J., Ochoa, H.A., **Environmental conditions for astronomical observations at the Belgrano II Station** [Condiciones ambientales para la observación astronómica en la Base antártica Belgrano II], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, ⌊Buenos Aires, Centro Latinoamericano de Física, 1990⌋, p.207-212, In Spanish. 4 refs.

The conditions which make Antarctica an ideal place for astronomical observations are reviewed, including its long periods of darkness, its solar position in summer, and its geographic location permitting the observation of eclipses only visible at high latitudes. To determine the sky quality at Belgrano II Station, observations were carried out between July 10 and Sep. 8, 1989, using a reflecting telescope 20 cm in diameter and 1 m focal length, with 10X and 15X oculars especially designed for field work. Results are analyzed and presented in tables. The preliminary conclusion is that, due to poor image quality, Belgrano II Station is not a recommended site for the installation of astronomical instruments of great value.

K-45133

Condal, A., Sánchez, R.N., **Astronomical observations in Antarctica** [Observaciones astronómicas en la antártida], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, ⌈Buenos Aires, Centro Latinoamericano de Física, 1990⌉, p.213-221, In Spanish. 3 refs.

A methodology is proposed for reliable determination of astronomical latitudes and longitudes, and a modernization of operations, in the antarctic environment. Two classic astronomical methods used in such determinations are compared with a new method called M3; all three are explained in detail and their precision factors are shown in a table. The M3 method is found to be a positive step toward the modernization and economy of astronomical research in hostile environments.

Rizzo Piazza, L., **Space research in Antarctica** [Pesquisas espaciais na Antártica], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, ⌈Buenos Aires, Centro Latinoamericano de Física, 1990⌉, p.231-244, In Portuguese. 10 refs.

A review is presented of the energy and dynamics of terrestrial atmospheric physics, and of studies on the subject carried out in Antarctica. The importance of antarctic investigation of geomagnetic and ionospheric phenomena, when compared to that in the Northern Hemisphere, is stressed in the light of the advantage of Antarctica's geographic location. Various pertinent illustrations are presented, including a map showing the principal antarctic stations where studies of upper atmosphere physics phenomena are conducted.

K-45136

Recabarren, P., Ochoa, H.A., Lombardo, M., **Upper atmosphere data recording at Belgrano II Station** [Actividad de registro de datos de alta atmósfera en Base antártica Belgrano II], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, ⌈Buenos Aires, Centro Latinoamericano de Física, 1990⌉, p.245-253, In Spanish.

The laboratory LABEL II at Belgrano II Station, its operations and the instruments used for recording geomagnetic and ionospheric data of the region, are described. Activities carried out during the last Argentine antarctic winter expedition are summarized. The advantages of computerized acquisition and control systems over the classic electronics, in the framework of high latitude operations, are pointed out. The eight most frequent problems connected with the functioning of upper air research equipment in Antarctica, such as various interferences and weather related problems, are listed.

K-45137

Cabassi, I.R., Gianibelli, J.C., Sallago, P., **Monthly averages of geomagnetic components X, Y and Z at Dumont d'Urville** [Analysis de promedios mensuales de los elementos geomagneticos X, Y, Z en el observatorio de Dumont d'Urville], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, ⌈Buenos Aires, Centro Latinoamericano de Física, 1990⌉, p.254-264, In Spanish. 19 refs.

Methods and instruments used in the analysis of monthly averages of components X, Y and Z are described, and tabulated data are presented. It is suggested that the Maximum Entropy Method, as given by Burg, is preferable to classic methods concerning the precision of results.

K-45138

Medrano, R.A., Abdu, M.A., Batista, I.S., Muralikrishna, P., **Possible instrumental cause of an anomalous sidereal time CNI variation observed in a riometer with directional antenna at the Brazilian station in Antarctica,** Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, ⌈Buenos Aires, Centro Latinoamericano de Física, 1990⌉, p.265-271, 10 refs.

This paper reports CNI measurements performed by three riometers operating at 30 MHz frequency, at the Comandante Ferraz Station, which have been in continuous operation since Dec. 1988. All three riometers use the same type of Yagi-Uda antenna. One of the antennas is directed to the zenith, while the other two are directed to the magnetic south and west at 40 deg zenith angle, respectively. Since the first months of the riometers' operation, only one maximum of intensity was noticed from the zenithal direction as well as from the west direction, but two maxima appeared in the riometer with antenna directed to the south. This same behavior was noticed for all the days of the year and at the same sidereal hours, which revealed that the two maxima from the southward direction were not due to solar or geomagnetic effects. It is concluded that the antenna might be operating with a radiation pattern other than the expected.

K-45139

Silbergleit, V.M., Schneider, O., **Auroral ruptures observed at Belgrano II Station** [Rupturas de auroras observadas en la Base General Belgrano], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, ⌈Buenos Aires, Centro Latinoamericano de Física, 1990⌉, p.272-282, In Spanish. 7 refs.

The potentially significant events leading to auroral break-ups are analyzed on the basis of observations carried out at Belgrano II Station in 1971. Four types of indicators are determined and described. The geomagnetic activity associated with the rupture lasts from 40 to 90 min.; it can coincide with the rupture, or precede it by 20 min., or follow it about 40 min. later.

K-45140

Rios, V.H., **Anisotropy in the polar wind plasma parameters for subsonic conditions** [Anisotropia en los parametros del plasma del viento polar para condiciones subsonicas], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, [Buenos Aires, Centro Latinoamericano de Física, 1990], p.283-292, In Spanish. 9 refs.

The processes involved in the formation of the magnetospheric tail, and its principal function, are described. Studies of electronic anisotropy in the solar wind are reviewed. In this work, an attempt is made to simulate the polar wind by the numerical solution of continuity, moments, energy and heat flow equations, considering the plasma types of bi-Maxwellian distribution and comparing them to results obtained, which are applied to subsonic conditions.

Zossi de Artigas, M.M., Manzano, J.R., **North and South auroral ring behavior during two substorms in Feb. 1984** [Comportamiento de los anillos aurorales norte y sur durante dos subtormentas de febrero de 1984], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, [Buenos Aires, Centro Latinoamericano de Física, 1990], p.293-301, In Spanish. 5 refs.

Analysis of effects of two substorms which occurred on Feb. 10 and 12, 1984, on auroral ring behavior in both hemispheres reveals the following: the effects of the disturbances are significant in both auroral zones; there was an auroral electrojet with western direction, significant in the night sector and extending toward higher latitudes; and asymmetric effects in the auroral rings were observed.

K-45142

Cazeneuve, H.A., **Magnetospheric response to the passages across the heliographic current,** Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, [Buenos Aires, Centro Latinoamericano de Física, 1990], p.302-311, 14 refs.

The present study encompasses a long period of geomagnetic observations at the antarctic stations, which starts with the dark period of 1972 and extends until the present. Several hundred passages of the Earth across the heliographic current sheet occurred during this period. In order to unravel the common trends at the antarctic stations, the intense storms from periods of minimum solar activity, such as 1974-77, are selected. Two periodicities are found in the patterns of geomagnetic activity at the antarctic stations. One is defined by the enhanced activity following the sector crossings, and the decline that trails such an enhancement, occurring between two successive sector boundary crossings. The other one consists of the daily cycles of activity occurring during the first portion of the active periods.

Bowman, G.G., **Daytime high-latitude trough and its possible association with travelling ionospheric disturbances,** *Annales geophysicae,* July 1991 9(7), p.476-486, 40 refs.

An analysis of ionograms from Ellsworth, Antarctica has shown that the size of the daytime trough (as determined by the equatorward slope in the isoionic contours) is a function of geomagnetic activity. The trough activity is more intense and the onset times are earlier for higher geomagnetic activity. The principal features of the daytime trough are compared with similar features observed for mid-latitude spread-F events. Evidence is presented to suggest that the day-to-day observation of the trough is a consequence of the passage of travelling ionospheric disturbances (TIDs) which originate around noon in the polar-cusp region (at approximately 80 deg CGlat). The different onset times are seen as a consequence of disturbance speeds also being a function of geomagnetic activity. Recent reports of the detection of TIDs in these daytime-trough regions are discussed. (Auth. mod.)

Kim, J.S., **Thermospheric temperatures measured at King Sejong Station, Antarctica,** *Korean journal of polar research,* June 1991 2(1) (Special issue), Second International Symposium on Antarctic Science, Seoul, Korea, Sep. 17-18, 1990. [Proceedings], p.203-211, 7 refs.

Previous measurements and associated theoretical studies indicated that the polar region plays a critical role in the overall thermospheric dynamics. Recently, in order to investigate the neutral temperatures and winds in the antarctic thermosphere, a high-resolution Fabry-Perot interferometer was installed at King Sejong Station. Interferometric measurements during Mar. 1989 showed unusually elevated thermospheric temperatures. This elevation may be due partly to major solar events that occurred in Mar. Initial comparisons of the observed temperature data with calculated values from semi-empirical MSIS thermospheric models showed consistent and significant differences, both qualitatively and quantitatively, between measured temperatures and calculated values. (Auth.)

Nagano, H., Sato, N., Ayukawa, M., **CNA pulsations associated with geomagnetic sudden commencements,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.4, Tokyo, National Institute of Polar Research, 1991, p.42-50, 17 refs.

In the cosmic radio noise absorption (CNA) data obtained at Showa Station, CNA pulsations were sometimes observed following geomagnetic sudden commencements (SC's). In order to investigate characteristics of the occurrence, 138 SC events were analyzed using 1-second CNA and geomagnetic data at Showa Station from Apr. 1981 to Dec. 1986. Local time dependence can be seen in the SC-associated CNA pulsation (CNA Psc). The occurrence rate is highest in the morning and has a secondary peak before midnight, showing a marked dawn-dusk asymmetry. CNA Psc accompanies geomagnetic Psc at the time of strong CNA increase caused by large SC's with high pre-SC *AE* index. CNA Psc tends to be correlated with the *H* component of magnetic Psc in the Psc 5 period range and the D component for shorter periods in the Psc 4 range. (Auth.)

Shibuya, S., Higuchi, Y., Sato, N., Maezawa, K., **Conjugacy of CNA pulsations and their source movement in the auroral zones,** NIPR Symposium on Upper Atmosphere Physics, Proceedings, :No.4, Tokyo, National Institute of Polar Research, 1991, p.51-61, 9 refs.

A statistical character of seasonal variation for the conjugacy of quasi-periodic cosmic radio noise absorption (CNA) is studied from measurements at Showa Station and its magnetically conjugate Husafell Station in Iceland. On the basis of the analyses of relative phase difference of the CNA pulsation for two cases among three stations in Iceland, the direction of source movement is also studied. Results indicate that the sources of CNA pulsation of Pc 3 and Pc 5 range in the prenoon sector moved generally from north (or high latitude) to south (or low latitude), and from east to west. The source of CNA pulsation at Pc 5 range in the morning sector moved primarily from south to north and from east to west. (Auth.)

Sazhin, S.S., **Group delay times of whistler-mode signals from VLF transmitters observed at Faraday, Antarctica,** *Journal of atmospheric and terrestrial physics,* Jan. 1992 54(1), p.99-107, 16 refs.

The group delay times (tg) of whistler-mode waves generated by the NAA and NSS U.S. Navy transmitters and recorded at Faraday, after following a ducted field-aligned path, are analysed theoretically for different L- shells of propagation using models of electron density, temperature, and ion composition distribution for typical day and night-time conditions. tg is presented as the sum of (1) a group delay time calculated for the simplest model of wave propagation parallel to the magnetic field in a cold, dense plasma with the effects of ions neglected (tg 0) and (2) the corrections due to finite electron density; that is, finite ratio of electron plasma frequency to electron gyrofrequency, contribution of ions, and non-zero electron temperature. (Auth.mod.)

Price, G.D., Jacka, F., **Influence of geomagnetic activity on the upper mesosphere/lower thermosphere in the auroral zone. I. Vertical winds,** *Journal of atmospheric and terrestrial physics,* Oct. 1991 53(10), p.909-922, 27 refs.

A scanning Fabry-Perot spectrometer (FPS) located at Mawson Station was used to obtain vertical wind, temperature, and emission intensity measurements from the lambda558 nm emission of atomic oxygen. The measured temperature is used to assign an approximate emission height to the observations. A spaced-antenna partial-reflection radar was run concurrently with the FPS from which the presence of enhanced ionization in the *D*-region could be inferred from the return heights and strengths of the echoes. Large upward winds of approximately 30 m/s at altitudes less than 110 km appear to be a direct response of the neutral atmosphere to intense auroral events. It is suggested that the observed upwelling is a result of particle heating at heights below the principal emission height. At higher altitudes, vertical winds of a similar magnitude are also measured during geomagnetically disturbed conditions, although here they do not appear to be associated with particular auroral events. In this case it is suggested that upwelling is produced by a combination of Joule and particle heating. (Auth.)

Price, G.D., Jacka, F., Vincent, R.A., Burns, G.B., **Influence of geomagnetic activity on the upper mesosphere/lower thermosphere in the auroral zone. II. Horizontal winds,** *Journal of atmospheric and terrestrial physics,* Oct. 1991 53(10), p.923-947, Numerous refs.

A spaced antenna partial reflection radar located at Mawson has been used to measure the horizontal wind field in the height range 70-110 km. Three years of data (1985-1987) from the radar have been analyzed to investigate correlations between geomagnetic activity and the horizontal wind. Results are analyzed using a randomization technique, and show that larger winds are measured during geomagnetically active periods in both the raw wind values and in the medium-frequency and high-frequency components. The raw winds tend to be shifted towards the geographic NW to NE quadrant in the early morning hours during high *K*-times. The observed correlation is seen down to 86 km and shows a seasonal dependence. The mean r.m.s. velocity of the radar scatterers and the angular spread of the return echoes correlate with geomagnetic activity. The medium- and high-frequency components of the wind are polarized in the magnetic zonal direction during all seasons of the year. (Auth.)

Du, J.H., Sun, X.R., **HF field strength measurements over a very long distance,** *Antarctic research,* June 1991 2(1), p.60-67, 8 refs.

There is a large gap between the theoretical values and experimental medians of the field strength of RWM and RID signals during high solar activity periods at the Great Wall Station. The calculated values are, on average, less than the experimental, especially on the propagation path between RID and Antarctica. The experimental field strength may be used as basic data for the research of HF propagation over a very long distance. Because of the large deviation, it is necessary to study HF propagation over a very long distance in detail, especially the propagation model. (Auth.)

Fligel, M.D., **Large-scale irregularities of electron concentration in the southern magnetic anomaly area according to Intercosmos 19 satellite data,** *Journal of atmospheric and terrestrial physics,* Feb. 1992 54(2), p.173-178, 15 refs.

Using Intercosmos 19 satellite topside sounding data, a type of complex ionogram for which the lowest frequency of the radio-wave which has passed through the ionosphere is smaller than the greatest frequency of the radio-wave reflected from the ionosphere is considered. (Under normal conditions these frequencies are identically equal.) A mechanism is suggested by which radio-waves transmitted by the satellite propagate over 3000 km in the topside ionosphere in the presence of inclined large-scale plasma structures, which can explain the main features of such ionograms. The space-time distribution of this phenomenon on a global scale is analyzed. It is shown that it manifests itself mainly in the local winter, in the daytime and in the Southern Hemisphere. It is hypothesized that these large-scale irregularities are formed in the vicinity of the South Atlantic magnetic anomaly, and then move westward. The Southern Hemisphere area included in this study extends to 70S, taking in the northern Antarctic Peninsula and some of the antarctic coastal regions. (Auth. mod.)

Wu, Q., Rosenberg, T.J., **High latitude pulsating aurorae revisited,** *Geophysical research letters,* Jan. 3, 1992 19(1), p.69-72, 14 refs.

Dayside auroral pulsations (10-40 s periods) have been studied for different levels of geomagnetic disturbance with N2+427.8 nm emission data obtained at South Pole Station. The occurrence distribution exhibits a single peak at magnetic noon under geomagnetically quiet conditions. With increased Kp, the distribution shifts to earlier times, the peak occurring at 1000-1030 MLT for 1 C/ E Kp C4. At these higher Kp levels a secondary occurrence peak is evident in the afternoon sector between 1400 and 1600 MLT, occurring earlier as Kp increases. These results are compared with those obtained separately for pre-noon pulsations observed at Ny Alesund and post-noon pulsations observed at Davis, Northern and Southern Hemisphere sites at approximately the same magnetic latitude as South Pole. South Pole and Ny Alesund observe morning peaks at the same time and with a similar lack of Kp dependence; South Pole and Davis observe afternoon peaks with similar Kp dependence, though the peak occurs earlier at Davis. In contrast to the results from the earlier studies, the South Pole observations show larger pulsation amplitudes in the morning sector and significantly higher occurrence rates overall. (Auth.)

Martínez de Garat, A., **Study of the south hemisphere F2 region winter anomaly,** *Revista de geofisica,* 1989 45(2), p.211-215, With Spanish summary. 7 refs.

An analysis of the behavior of the ionospheric parameter foF2 to study the winter F2 region has been made. In order to give an opinion about the existence of the so-called winter anomaly, the foF2 behavior during the local winter and summer for an important number of stations around the world has been studied. The analyzed data, which correspond to two solar cycles for Jan. and July, were also compared with the solar activity. Associated with the winter anomaly and in order to be able to decide both its presence and its magnitude, it is proposed to work with a certain index. The following conclusions could be considered the most important: 1) with respect to the F2 region winter anomaly, the north hemisphere behavior differs substantially from the southern one, and 2) the F2 region winter anomaly must be redefined, since in the author's analysis only the north hemisphere shows the "anomalous" behavior. Data from Port Stanley in the Falkland Is. and from Argentine Is. near the Antarctic Peninsula are included. (Auth. mod.)

Von Biel, H.A., **Ionisation in the antarctic stratosphere,** *Journal of atmospheric and terrestrial physics,* Mar./Apr. 1992 54(3/4), p.235-242, 21 refs.

Results from a partial reflection radar experiment, operated at a frequency of 2.9 MHz at Scott Base, are presented for the time interval from Jan. 1987 to June 1991. It is shown that a layer of ionization can frequently be identified at scattering heights between 40 and 55 km. Details regarding the maximum density, thickness, and frequency of occurrence of this ionization layer are presented. From sequential occurrences of the ionization an approximate lifetime of 70 min is deduced for the layer. The possibility that the ionization layer is produced by a flux of relativistic electrons is investigated. (Auth.)

Mielke, T.A., Elkins, C.J., Helliwell, R.A., Inan, U.S., **Excitation of whistler mode signals via injection of polarized VLF waves with the Siple transmitter,** *Radio science,* Jan./Feb. 1992 27(1), p.31-46, 14 refs.

Whistler mode waves of various polarizations were transmitted by the Siple Station VLF transmitter and received near the geomagnetic conjugate point at Lake Mistissini, Quebec. Crossed 21 km horizontal dipole antennas on top of the 2 km thick ice sheet were used to transmit 2- to 4-kHz waves alternately with right-hand circular, left-hand circular, and linear polarizations. Excitation of a multiplicity of magnetospheric propagation paths and the received signal strength were observed to depend on the transmitter antenna polarization. Where whistler mode growth and emission triggering occurred, saturated peak values of received signals were independent of antenna polarization and initial injected power levels, in agreement with previous findings. Propagation paths of ducted Siple signals observed at Lake Mistissini were identified with propagation paths deduced from natural whistlers, from which the *L* shell values and equatorial number densities for the paths were calculated. A combination of *L* shell data and models of antenna coupling into the whistler mode may aid in the location of ducts. Dynamics Explorer 1 satellite recordings of unducted Siple signals showed trends similar to the ground data on ducted signals. The observations are discussed in the context of a simplified model of the coupling from the Siple antenna into the ionosphere, which provides reasonable agreement with observations. (Auth.)

Hansen, H.J., **High latitude Pc 1 bursts arising in the dayside boundary layer region,** *Journal of geophysical research,* Apr. 1, 1992 97(A4), p.3993-4008, Refs. p.4007-4008.

Dayside Pc 1 geomagnetic pulsation bursts have been studied using a three-station array of induction magnetometers located at high latitudes. The data set reveals that when these emissions are continually recorded at Davis Station, the low-latitude cleft, observed by the DMSP F7 satellite, is located at the Davis latitude. Associated magnetic variations in the form of solitary pulses often lead the Pc 1 bursts by 1 to 2 min. These pulses are typically associated with riometer absorption events and consequently the precipitation of fluxes of keV electrons. The Pc 1 bursts are interpreted as resulting from ion cyclotron waves which have propagated to the ionosphere from the equatorial boundary layer region. The associated boundary layer ions, identified by the low-altitude DMSP F7 satellite, range between 1 and 5 keV in energy. These particles are considered to be the most likely free energy source for the ion cyclotron waves. It is considered that such resonant ions enter the magnetosphere via the cleft and cusp, because this enables the prenoon time of occurrence of most of the observations to be explained. (Auth. mod.)

Kadokura, A., **Upper atmosphere physics data, Syowa and Asuka Stations, 1989,** *Japanese Antarctic Research Expedition. JARE data reports,* Feb. 1992 No.171, 335p., 10 refs.

The report summarizes upper atmosphere physics data acquired by the Upper Atmosphere Physics Monitoring System at Showa and Asuka Stations in 1989. The items of observations at both stations are as follows: geomagnetism; ionosphere (cosmic noise absorption at 30MHz); and aurora (meridian scanning record at 3 wavelengths). ELF-VLF waves were observed at Showa Station only. The systems were installed at Showa Station in Jan. 1981, and at Asuka in Jan. 1987. An outline of the systems, specifications of the observation instruments, the recording periods, and the format of the compiled digital data are included. Magnetograms and frequency-time spectra of magnetic pulsations for Jan. 1-Dec. 31, 1989 at both stations are given in Appendices 1 and 2.

Cazeneuve, H., Grinspon, M., **Prediction of geomagnetic activity at high austral latitudes,** *Revista de geofisica,* 1990 46(2), p.193-197, 13 refs. For Spanish original see 19K-44698.

Results of an application of linear predictive theory to the prediction of magnetic activity are presented. Data from 7 antarctic stations and solar wind parameters have been used. The approximation of the predicted time series is quantitatively estimated by computing the prediction efficiency. Since an approximately linear association between geomagnetic variations and those of the interplanetary electric field is apparent, it is found that the magnetosphere responds like an approximately linear system. The study shows that geomagnetic variations at antarctic stations can be reasonably predicted by applying a deformation, by means of a linear filter, to the interplanetary parameters. The filter function attains a first maximum within one hour after the initial power input, and a secondary maximum 5 hours later. This indicates a rapid response following the power input from the solar wind, and a delayed excitation, which in turn is followed by several damped oscillations. (Auth.)

Hamar, D., **Trace splitting of whistlers: a signature of fine structure or mode splitting in magnetospheric ducts,** *Radio science,* Mar.-Apr. 1992 27(2), p.341-346, 8 refs.

Previously, the discovery of fine structure in whistler data received on the ground at Halley was reported. This structure was not apparent in conventional spectral analysis but was revealed by the technique of digital matched filtering. A larger data set was examined and a commonly observed phenomenon is that single whistler traces become split into two, over various frequency ranges. The splitting is typically 5-15 ms and extends over frequency ranges of a few hundred hertz which may occur anywhere between the upper and lower cutoff frequencies of the whistler. The splitting may be either symmetrical or unsymmetrical with respect to the unsplit trace. The effect is unlikely to arise in the spectrum of the lightning source or from propagation under or through the ionosphere. It may, however, be a signature of field-aligned fine spatial structure in plasmaspheric density, and hence refractive index, in the whistler duct. For simple longitudinal propagation, electron density fluctuations of the order of 1% and spatial scale sizes of the order of 50 km in the equatorial plane are implied. It seems possible that the observations could also be interpreted in terms of the mode theory of ducted propagation, assuming the excitation of two modes with group velocities differing by a few tenths of a percent. (Auth. mod.)

Hoegy, W.R., Grebowsky, J.M., **Dependence of polar hole density on magnetic and solar conditions,** *Journal of geophysical research,* Apr. 1, 1991 96(A4), p.5737-5755, 21 refs.

The dependence of electron density in the polar *F* region ionization hole on solar activity, universal time (UT), magnetic activity, season, and hemisphere is studied using data from the Langmuir probes on Atmosphere Explorer C and Dynamics Explorer 2. The AE-C data were obtained during solar minimum when the 3-month average 10.7 cm solar flux index varied from 70 to 140; the DE 2 data were obtained near solar maximum when the 10.7 cm solar flux index varied from 120 to 220. The polar hole is a region on the nightside of the polar cap where reduced ionization exists because of the long transport time of ionization from the dayside across the polar cap. The behavior of this region as a function of 10.7 cm solar flux (*F* 10.7), UT, and *Kp* is statistically modeled for equinox, summer, and winter conditions for each hemisphere separately. The strongest dependencies are observed in *F* 10.7 and UT; the *Kp* dependence is weak because it poorly represents the complexities of convection across the polar cap. A strong hemispherical difference due to the offset of the magnetic poles from the Earth's rotation axis is observed in the UT dependence of the ionization hole. There is an overall asymmetry in the density level between hemispheres; it was found that the winter hole density is about a factor of 10 greater in the north than in the south. (Auth. mod.)

Jefferies, S.M., Pomerantz, M.A., Duvall, T.L., Jr., Harvey, J.W., **Helioseismology from South Pole: Solar cycle connection,** *Antarctic journal of the United States,* 1990 25(5), p.271-272, 9 refs.

The structure and dynamics of the solar interior can be probed by measuring the frequencies of solar global acoustic oscillations. This technique, known as helioseismology, is described. A report is presented of observations made in Dec. 1981, Nov. 1987, and Nov. 1988, at the Amundsen-Scott Station, during high and low solar activity. The first significant result is that the frequencies of solar oscillations with spherical harmonic degrees between 6 and 98 are systematically about 0.01% greater when solar activity is high. It was also found that the internal rotation of the Sun did not change significantly as a function of solar activity, and that the lifetime of oscillation modes varies with the solar cycle.

Bieber, J.W., Evenson, P., Pomerantz, M.A., **Unusual cosmic ray spike,** *Antarctic journal of the United States,* 1990 25(5), p.277-278, 2 refs.

During a 4-month period beginning July 25, 1989, the Sun released an unprecedented barrage of 7 relativistic solar-particle events which could be detected with ground-based instruments. Neutron monitor observations of a ground-level enhancement which began on Oct. 22, 1989 are presented in a figure. The time profile recorded in Thule, Greenland, is fairly representative of a normal ground-level enhancement time profile; in contrast, those recorded simultaneously at Amundsen-Scott and McMurdo stations do not look normal because of the presence of a huge spike at event onset. At this point the physical cause of the cosmic ray spike remains unclear.

Hernandez, G., Clark, K.C., Smith, R.W., Kauffman, S.D., **South Pole mesospheric and lower-thermospheric dynamics,** *Antarctic journal of the United States,* 1990 25(5), p.278-279.

An optical experiment at Amundsen-Scott Station, using an automatically scanned Fabry-Perot spectrometer, is described. The instrument began mesosphere and lower thermosphere observations during early Apr. 1990 and has supplied data for several days when the sky was clear. Samples of winds observed using the OH 11902 K emission at a height of about 87 km are shown in a figure. There is a long-term variation similar to a 12-hour tide underlying the expected fluctuations. A different wind pattern is seen for the atomic oxygen 17924 K green line data on the same day, shown in another figure, indicating the change of regime above the mesopause. A strong resemblance to the ionospheric convection-driven wind pattern of the upper thermosphere can be noted. This can be seen in the figure as strong anti-Sunward wind near magnetic midnight.

Detrick, D.L., Rosenberg, T.J., **Geometrical factors affecting the frequency dependence of auroral absorption,** *Antarctic journal of the United States,* 1990 25(5), p.280-283, 5 refs.

The results are presented from an intense dusk-side absorption event, which exhibited arc-like structure, and is typical of the absorption events observed at the Amundsen-Scott Station during that local time. The event occurred on June 15, 1988 near 2205 universal time, and reached a magnitude in excess of 6.5 decibels in the IRIS data. This was a large absorption event but not the largest observed with the IRIS instrument. Magnetic midnight at South Pole is about 0330 universal time, so this event occurred about 5 hours pre-midnight. The results shown are representative of those obtained from the events examined. Those events which are associated with small-spatial-scale precipitation regions show deviation of the spectral index from the theoretical value of 2; those events which cover the entire field of view of the broadbeam antenna show no deviation. No event was found in the broadbeam data which was not consistent with the simulation using the IRIS data.

Cahill, L.J., Jr., Engebretson, M.J., Arnoldy, R.L., **Magnetic pulsations in the polar cap,** *Antarctic journal of the United States,* 1990 25(5), p.283-284, 3 refs.

It is found that pulsations in the polar cap are strongly affected by auroral oval activity, and not only when the Amundsen-Scott Station is under the dayside auroral oval and cusp, 0430 to 1430 magnetic local time. There is also an evening maximum of activity seen in the averaged data, 2030 to midnight magnetic local time, presumably related to evening auroral oval activity. This activity is seen as bursts of pulsations on individual days, occurring at random times in the evening. Although the bursts on individual days occur at random times, when the data is averaged a broad evening maximum is produced.

Byrne, G.J., Benbrook, J.R., Bering, E.A., **Ultraviolet radiation in the stratosphere: implications for photoelectric contamination of measurements from antarctic balloon campaigns,** *Antarctic journal of the United States,* 1990 25(5), p.285-286, 6 refs.

The contamination of electrical measurements in the stratosphere using balloonborne double-probe systems has been observed, caused by local photoelectric emissions. The solar ultraviolet radiation responsible for the photoemissions are primarily those in the range of 190-230 nanometers. At these wavelengths the atmosphere is partially transparent, allowing a large flux of energetic photons to penetrate deep into the stratosphere. In future antarctic balloon campaigns which will employ double-probe instruments, photoemissions may introduce variations in the electrical measurements as functions of solar angle and altitude that may be misinterpreted as diurnal, latitudinal, or altitudinal variations of a geophysical nature.

Troshichev, O.A., Nishida, A., **Pattern of electron and ion precipitation in northern and southern polar regions for northward interplanetary magnetic field conditions,** *Journal of geophysical research,* June 1, 1992 97(A6), p.8337-8354, 37 refs.

Using the data of the DMSP F6 and F7 satellites, the authors show that there is a systematic difference between ion precipitation in the auroral oval and in the polar cap. Four patterns of electron precipitation in the polar cap are identified for northward IMF conditions: symmetric precipitation in both polar caps with no distinct regularity; symmetric precipitation with a prevalence of electron fluxes in the morning sector of both polar caps; asymmetric distribution with no correspondence between patterns in the opposite polar regions; and asymmetric distribution where the increased electron fluxes are observed in opposite sectors (morning or evening) of the opposite polar caps depending on the polarity of the By IMF component. The energy spectra of electrons even in neighboring spikes in the same polar cap may be greatly different, and therefore discrepancy in electron spectra in opposite polar caps cannot be regarded as unique proof for the open character of the magnetic field lines. Pereira, E.B., ed, Kirchhoff, V.W.J.H., ed, **Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings** [Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro, São José dos Campos, SP, 27 a 29 de abril de 1988], Brazil, Instituto de Pesquisas Espaciais, 1989, 317p., In Portuguese. Refs. passim. For individual papers see A-46629 through A-46632, I-46618 through I-46627, K-46614 through K-46617 and K-46628.

This is a collection of papers presented at the First Seminar on Atmospheric and Space Sciences, reporting results of investigations conducted during the first 6 years of the Brazilian Antarctic Program. The papers are arranged in the following categories: astrophysics, upper atmosphere, lower atmosphere, meteorology, and instrumentation and techniques. Associated topics deal with environmental issues in general, and Brazilian antarctic policy in particular.

Jayanthi, U.B., **X and gamma ray background observations in Antarctica,** Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.1-15, 14 refs.

Atmospheric X and gamma rays are products of complex electromagnetic interactions between charged particles and atmospheric constituents. The latitudinal dependence of the cosmic ray secondaries, auroral and South Atlantic Anomaly phenomena produce flux variations, especially the later temporal flux variations. These variations are discussed in relevance to balloon flight observations of X and gamma ray atmospheric background at polar latitudes. (Auth.)

Trivedi, N.B., Padilha, A.L., Da Costa, J.M., **Geomagnetic and geoelectric pulsations at Comandante Ferraz Station** [Micropulsações geomagnéticas e geoelétricas na estação antártica Comandante Ferraz], Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.29-39, In Portuguese with English summary. 10 refs.

Geomagnetic and geoelectric pulsations in the range from 10 to 500 seconds are recorded at Comandante Ferraz Station on the Antarctic Peninsula. The characteristics of the PC3 and PC4 micropulsations are studied and discussed in terms of hydromagnetic waves generated at the sunward side of the earth's magnetosphere. The same measurements are also used to obtain a local conductivity profile of the earth's crust and upper mantle, using principles of electromagnetic induction. (Auth.)

Balboa, R.A.M., Abdu, M.A., Batista, I.S., **Ionospheric research in Antarctica: cosmic noise measurements** [Pesquisas ionosféricas na Antártica: medidas de ruído cósmico], Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.40-61, In Portuguese with English summary. 9 refs.

Two riometers with antennas pointing one to the zenith and the other inclined to the south were installed and operated during the summer season of 1987-1988 at Comandante Ferraz Station. Preliminary results identifying an apparent seasonal behavior in the ionospheric absorption, observed in the cosmic noise intensity recorded by the inclined antenna, and some energetic particle precipitation events, are presented. The present experiment with riometers is part of a more broad and complete ionospheric research project in Antarctica proposed by the INPE (Instituto de Pesquisas Espaciais) team. A description of such a project, showing its importance in the study of the auroral and subauroral regions and their coupling with the ionosphere of the equatorial latitudes, is also presented. (Auth.)

K-46628

Turtelli, A., Jr., **Studies of cosmic ray sources at high latitudes** [Estudos de fontes de raios cósmicos a grandes latitudes], Ciências atmosféricas e espaciais na Antártica. Anais do I Seminário Sobre Ciências Atmosféricas e Espaciais do Programa Antártico Brasileiro. (Atmospheric and space sciences in Antarctica. First Seminar on Atmospheric and Space Sciences of the Brazilian Antarctic Program, São José dos Campos, Apr. 27-29, 1988. Proceedings.) Edited by E.B. Pereira and V.W.J.H. Kirchhoff, Brazil, Instituto de Pesquisas Espaciais, 1989, p.231-243, In Portuguese with English summary. 3 refs.

Since Dec. 1986 a small telescope has been working at the Comandante Ferraz Station to measure anisotropy of cosmic radiation in the energy region beyond 100 TeV. A preliminary analysis of the first results is presented here. (Auth.)

Mendes da Costa, A., Rizzo Piazza, L., **Diurnal lower ionosphere electron density variations observed in the South Atlantic Geomagnetic Anomaly and sub-Antarctic region during the occurrence of the major PCA event of 4 August 1972,** *Journal of atmospheric and terrestrial physics,* Jul./Aug. 1992 54(7/8), p.903-913, 43 refs.

VLF phase and amplitude signals simultaneously received in Atibaia and Curitiba, both in Brazil, were analyzed during the occurrence of the major proton flare event of Aug. 4, 1972. Phase advances recorded in Stockholm, Sweden and Inubo, Japan were also included for comparison purposes. Particular attention was devoted to the NWC (Australia)-Atibaia (Brazil) propagation path which passes through disturbed regions (geomagnetically), namely the subantarctic region and the South Atlantic Geomagnetic Anomaly (SAGA), and which propagates completely in the Southern Hemisphere. Following the current mechanisms that allow charged particles to precipitate at low altitudes in the ionosphere (D-region), four regions were defined, based on the most significant 'L' value involved. By means of successive comparisons with low- and mid-latitude propagation paths, some parameters typical of the lower ionosphere were deduced for the Southern Hemisphere in association with PCA events detected in the polar caps. By fitting exponential models to the data analyzed, daytime electron density profiles were obtained for different 'L' values throughout the disturbed period. (Auth.)

Constable, C., **Link between geomagnetic reversal paths and secular variation of the field over the past 5 Myr,** *Nature,* July 16, 1992 358(6383), p.230-233, 25 refs.

Palaeomagnetic records provide information about the behavior of the geomagnetic field during reversals. Existing records are incompatible with transitional field configurations that are either entirely dipolar or entirely zonal. Recent compilations have indicated that the transitional paths of virtual geomagnetic poles (VGPs) for the past few reversals are located preferentially within two antipodal longitudinal bands, suggesting that simple but non-zonal field configurations dominate during reversals. It is pointed out that one of the longitudinal bands coincides with that expected from the reversal of a non-axial-dipole field exactly like that present today; the other requires only a sign change in the non-axial-dipole terms of today's field. Evidence for persistent non-zonal contributions to the field has generally (but not always) been regarded as not statistically significant in the light of poor data distributions. It is shown here that a non-zonal bias, similar to that observed in reversal data, is evident in data on secular variation of the field over the past 5 Myr, even after normalization according to site locations. These results suggest that the time-averaged field does indeed contain persistent (but not constant) non-zonal contributions. (Auth.)

K-46674

Burns, G.B., **Dynamics of the conjugate post-noon regions during an auroral enhancement,** *Journal of geomagnetism and geoelectricity,* 1992 44(2), p.65-90, 33 refs.

The morphological development of an event in the conjugate post-noon auroral ovals over a period of an hour is presented. A Viking UV camera imaged the northern dayside oval with a temporal resolution of 60 or 80 s while an active auroral form was observed by all-sky and keogram cameras to move through the zenith at South Pole Station. Early in the event a general similarity of form and development is observed between the hemispheres, but implying that the Northern Hemisphere forms are located on the order of four degrees of latitude higher, and on the order of one hour of MLT later, than IGRF calculated conjugate locations. Later in the event conjugacy is more difficult to establish. Short-lived features in the Southern Hemisphere photographs for which no Northern Hemisphere conjugate can be found imply that local acceleration processes may be important in this time sector. (Auth.)

Ono, T., Hirasawa, T., **Apparent lifetime of auroral 630.0 nm (OI) emissions,** *Journal of geomagnetism and geoelectricity,* 1992 44(2), p.91-108, 28 refs.

An apparent lifetime of the auroral red line (630.0 nm OI) emission was investigated by using monochromatic auroral TV images obtained on July 18, 1984, at Showa Station. An evaluation of mean energy of the incoming electrons was made by using the temporal variation of the red line intensity. The observed red line intensity is compared with a synthesized variation of the auroral red line, solving differential equations for chemical reactions in the auroral ionosphere as well as the deactivation of excited state oxygen atoms. The observational results showed that the red line intensity changed gradually, keeping an apparent lifetime of about 35-40 sec, while the green line intensity changed step-wise. The lifetime found is significantly smaller than the value (about 110 sec) previously used for the interpretation of 630.0 nm (OI) auroral emission. The comparison showed that the observed apparent lifetime is consistent with a synthesized aurora excited by low energy electrons with a characteristic energy of 0.2-0.5 keV. (Auth.)

Conde, M., Greet, P., Jacka, F., **Ring effect in the sodium D2 Fraunhofer line of day skylight over Mawson, Antarctica,** *Journal of geophysical research,* July 20, 1992 97(D11), p.11,561-11,565, 20 refs.

A dual scanning Fabry-Perot spectrometer at Mawson was used to obtain simultaneous direct solar and daytime sky spectra of the sodium D2 Fraunhofer absorption line at lambda = 589 nm. The intensity of the Ring component of skylight was determined from these spectra. These observations indicated that the absolute intensity of this component varied diurnally, maximizing at local noon. Observations over ice and snow gave greater absolute Ring intensities than those over open water. Fractional Ring intensities were typically 6% of the adjacent day sky continuum. During full daylight, no significant variation in fractional Ring intensity was observed with changing solar zenith angle; sharp increases were observed during twilight. These observations are consistent with the thesis that inelastic molecular scattering in the atmosphere is the cause of the Ring effect. (Auth. mod.)

Kato, K., Tonegawa, Y., Sato, N., **Estimation of geomagnetic conjugate points by using Pc5 pulsations,** *Antarctic record,* Mar. 1992 36(1), p.1-14, In Japanese with English summary. 17 refs.

An attempt to estimate geomagnetic conjugate points by the method of Tonegawa and Sato using Pc5 geomagnetic pulsation data obtained simultaneously at 3 stations in Iceland and three stations in Antarctica, during Mar. and May of 1988, is reported. It is assumed in the estimation that Pc5 pulsations are odd mode standing oscillations of the field line and have linear phase variations among the stations in the horizontal plane. Results show that conjugate points of Showa Station estimated from Pc5 events are concentrated around the point calculated from the magnetic field model of Tsyganenko, within the range of +/- 3 deg in longitude, *i.e.,* less than 1/5 wavelength, and +/- 0.5 deg in latitude. Mayr, H.G., Harris, I., Dube, M., **Polar thermospheric Joule heating, and redistribution of recombination energy in the upper mesosphere,** *Journal of atmospheric and terrestrial physics,* Feb. 1990 52(2), p.103-112, 64 refs.

W.W. Kellogg suggested in 1961 that transport of atomic oxygen from the summer into the winter hemisphere and subsequent release of energy by three-body recombination, O+O+N2 to O2+N2+E, may contribute significantly to the so-called mesopause temperature anomaly (increase in temperature from summer to winter). In the auroral region of the thermosphere there is a steady energy dissipation by Joule heating, causing a redistribution and depletion of atomic oxygen due to wind-induced diffusion. With the removal of O, latent chemical energy normally released by three- body recombination is also removed, and the result is that the temperature decreases by almost 2% near 90 km. Through dynamic feedback, this process reduces the depletion of atomic oxygen by about 25% and the temperature perturbation in the exosphere from 10% to 7% at polar latitudes. Under the influence of the internal dynamo interaction, the prevailing zonal circulation in the upper thermosphere changes direction when the redistribution of recombination energy is considered. The above described effects are very sensitive to the adopted rates of eddy diffusion. They are also strongly time dependent and are significantly reduced for disturbances associated with magnetic storms. The data presented here have equal application to the polar regions of both hemispheres. (Auth. mod.)

Mendes da Costa, A., Rizzo Piazza, L., ***D*-region electron density diurnal changes observed in association with the PCA event of July 1974,** *Journal of atmospheric and terrestrial physics,* Sep. 1992 54(9), p.1169-1175, 25 refs.

Well-defined diurnal phase and amplitude deviations of very low frequency radio signal propagation were detected during the solar proton event that occurred from July 3- 8, 1974. Phase advances observed on signals transmitted from GBR (U.K.), received at Atibaia (Brazil) and at Inubo Radio Observatory (Japan), were compared with simultaneous NWC (Australia) transmissions received at Atibaia, and at Showa Station (Antarctica). Emphasis was given to the propagation paths NWC-Atibaia and NWC-Showa, because both propagate completely in the Southern Hemisphere, crossing regions where the Earth's magnetic field behaves anomalously. The comparison allowed the determination of parameters typical of the *D*- region at a given height in the lower ionosphere, for geomagnetic regions defined through the McIlwain parameter (L). An exponential model was adopted to fit the vertical distribution of the diurnal electron density. The experimental results showed a delayed contribution to the total ionization observed, which was attributed to a slow precipitation of energetic particles in the South Atlantic Geomagnetic Anomaly region. (Auth.)

Zhao, X.Z., **Influences of solar flare bursts and particle precipitations on the polar lower ionosphere,** *Antarctic research (Chinese edition),* Mar. 1992 4(1), p.36-41, In Chinese with English summary. 5 refs.

The influence of solar flare bursts and particle precipitation on the lower ionosphere has been observed by means of VLF propagation effects at Zhongshan Station. Sixty solar flare bursts were observed in one month, of which the largest one caused a decrease of 8.7 km in the lower ionospheric effective reflecting height. The HF telecommunication between particle precipitation events was observed 58 hours after the flare burst; a decrease of 3.5 km in the lower ionospheric effective height was noted. (Auth.)

Yang, S.F., **Comparison of geomagnetic micropulsations at the Great Wall Station, Antarctica, and Beijing,** *Antarctic research (Chinese edition),* Mar. 1992 4(1), p.42-50, In Chinese with English summary. 7 refs.

A comparison of geomagnetic micropulsations observed in Antarctica and Beijing was carried out during the first Chinese expedition to Antarctica. Data analysis shows that during the geomagnetic quiet days, quiet pulsation activity is dominant in both areas, that Pc1/Pc4-5 pulsations occur sometimes in Antarctica and Pc3 pulsations in Beijing, and that Pi pulsations seldom occur. However, during geomagnetically disturbed days, Pi pulsations increase in both areas and they have a good corresponding relation, but those in Antarctica are stronger than those in Beijing. (Auth.)

Cotton, P.D., Smith, A.J., **Signature of burst particle precipitation on VLF signals propagating in the antarctic Earth-ionosphere waveguide,** *Journal of geophysical research,* Nov. 1, 1991 96(A11), p.19,375-19,387, 40 refs.

The burst precipitation of energetic electrons (>40 keV), induced by interactions with lightning-generated whistler mode waves, has been observed to cause phase and amplitude perturbations on subionospheric VLF signals ("Trimpi" events). With a knowledge of the propagation characteristics of the subionospheric signal, analysis of the perturbation details can lead to estimates of the energy, extent, and location of the precipitation. Trimpi events have been observed on VLF signals propagating at high latitudes (L>4) over Antarctica, on 3.79 kHz signals transmitted from the horizontal dipole at Siple Station. A mode theory computer model for propagation of VLF waves in the antarctic earth-ionosphere waveguide is used to illustrate the characteristics of 3.79 kHz signals as they propagate from Siple toward VLF receivers at Halley and Amundsen-Scott stations. To simulate the effects of precipitation, localized depressions in the ionospheric reflection height are introduced over the great circle propagation paths in the model, and it is seen that, while the amplitude and phase perturbations of some specific events are accurately reproduced, large positive amplitude (up to 6 dB) Trimpi events at Halley cannot be reproduced. Calculations are presented which show that signals echoing from precipitation patches located away from the great circle path could be the cause of such signatures. (Auth.)

Carpenter, D.L., **Case study of plasma structure in the dusk sector associated with enhanced magnetospheric convection,** *Journal of geophysical research,* Feb. 1, 1992 97(A2), p.1157-1166, 46 refs.

In a case study from June 8-9, 1982, data from ground whistler stations Siple and Halley located at L about 4.3 and spaced by about 2 hours in MLT, and from satellites DE1 and GEOS 2, have provided confirming evidence that the bulge region of the magnetosphere can exhibit an abrupt westward "edge," as reported earlier from whistlers. The present data and previous MHD modeling work suggest that this distinctive feature develops during periods of steady or declining substorm activity, when dense plasma previously carried sunward under the influence of enhanced convection activity begins to rotate with the Earth at angular velocities that decrease with increasing L value and becomes spirallike in form. (Auth. mod.)

Meinhold, P.R., **Anisotropy measurements of the Cosmic Background Radiation at 3 mm wavelength and an angular scale of 30 arcminutes,** Berkeley, University of California, 1990, 109p., University Microfilms order No. 91-26703, Ph.D. thesis. Refs. p.107-109.

This dissertation is concerned with measurements of the anisotropy in the Cosmic Background Radiation (CBR)at 3 mm wavelength, on angular scales from 5 arcminutes to 1 degree. Measurements of the galactic plane show unexpectedly high emission at 3 mm, inconsistent with the previously accepted single component galactic dust model with a scaling index of 2. These measurements were carried out with a 1 m off-axis telescope designed for operation from a stratospheric helium filled balloon, but also used on the ground from the South Pole. The development of the instrument is described, and details of the optical system, detector, and servo system are given. Discussions of the performance of the various subsystems, along with the limitations of the instrument, are included. Two balloon flights and an expedition to the South Pole are described, and the data from the South Pole expedition are discussed in detail. The method used to produce upper limits to CBR fluctuations is explained, and the relevance of these limits to current theories of structure formation is discussed. A brief outline of ongoing and future work is given. (Auth. mod.)

Yamagishi, H., ed, NIPR Symposium on Upper Atmosphere Physics, 14th, Tokyo, Jan. 22-23, 1991, **Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No.5,** Tokyo, National Institute of Polar Research, 1992, 80p., Refs. passim. For selected papers see K-47177 through K-47179.

This volume contains 10 selected scientific papers among 69 individual contributions presented at the 14th Symposium on Coordinated Observations of the Ionosphere and the Magnetosphere in the Polar Regions, held at the National Institute of Polar Research on Jan. 22-23, 1991. One full-length paper and two extended abstracts are pertinent to Antarctica and deal with the following: instruments for atmospheric chemistry and radio astronomy, data collection from Showa Station for space weather forecasting, and polar cap AE indices.

K-47177

Ochiai, S., **Antarctic radio telescope for atmospheric chemistry and radio astronomy,** NIPR Symposium on Upper Atmospheric Physics, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.1-9, 6 refs.

Antarctica is an extremely suitable site for ground-based submillimeter wave remote sensing and radio astronomy. In particular, the very low water vapor concentration in the antarctic atmosphere is advantageous in millimeter and submillimeter wave observations of the upper atmosphere and astronomical objects. A radio telescope with an antenna of 60 cm aperture diameter with low noise superconducting receivers covering the frequency range from 200 to 280 GHz will be installed in Antarctica for atmospheric chemistry and astronomy uses. Chlorine monoxide and hydroperoxyl, which are concerned with ozone chemistry, and observations of the Milky Way of the Southern Hemisphere, and Magellanic Clouds at 230 GHz of carbon monoxide emission line, will be carried out. The telescope is now under development at the Communications Research Laboratory in collaboration with the University of Tokyo. The millimeter wave observation will start in 1994 at Showa Station. (Auth. mod.)

Tokumaru, M., **Near-realtime data collection from Syowa Station and its utilization for space weather forecast (Extended abstract),** NIPR Symposium on Upper Atmospheric Physics, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.26-30, 7 refs.

Acquisition and transfer systems of observational data at Showa Station using an INMARSAT link have been developed. With this system, near-real time data from Antarctica become available in Japan. To apply these data to space weather forecast, the *J*-index is introduced for a real time evaluation of geomagnetic activities, which showed a good correlation with the *K*-indices.

K-47179

Saroso, S., **Derivation of polar cap AE indices,** NIPR Symposium on Upper Atmospheric Physics, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1992, p.35-45, 15 refs.

The authors have derived, on a test basis, a geomagnetic index by using presently available data in the southern polar cap; observatories used are located at Scott Base and Dumont d'Urville, Vostok and Mirnyy Stations. To derive disturbance fields, a base value of each station for each month is first calculated using a moving average method, and this base value is subtracted from hourly data from the station in that month. Then, after a coordinate conversion, the largest and smallest values are selected from the 4 stations in the same way as the AU and AL indices are derived. The results of the variation of the disturbance fields from the 4 stations show a clear diurnal and seasonal variation depending on distribution of the stations and the ionospheric conductivities in the southern polar cap. The highest correlation is found between the polar cap AE indices and the AE, AU, and AL indices in the local winter; the correlation decreases in the local summer due to the increases of the ionospheric conductivity in the polar cap caused by solar UV radiation. (Auth. mod.)

Barr, R., **Simple theoretical model of the diffraction of VLF electromagnetic waves by the antarctic icecap,** *Journal of atmospheric and terrestrial physics,* Nov./Dec. 1992 54(11/12), p.1527-1533, 19 refs.

The antarctic continent has been modelled as a spherical cap whose pole is coincident with that of the South Pole, which totally absorbs VLF radio waves attempting to propagate over it. The propagation of Omega navigation signals around this model icecap has then been computed using the Kirchhoff diffraction theory. Spherical caps extending to 66.5 and 75.5S have been found to accurately model the signals from Omega La Reunion and Argentina, respectively, received on flights between Christchurch, New Zealand and Scott Base in Antarctica, up to the boundary of the theoretical icecap. These model icecaps were found to be good fits to the boundary of the antarctic continent, when measured at the 1-1.5 km contour of ice thickness, in the region where the VLF waves diffracted around the icecap. The good agreement obtained between the experimental field strength data and those computed theoretically, using only simple diffraction theory, suggests that coastal refraction plays at most only a secondary role in circumpolar propagation. (Auth.)

Morris, R.J., Cole, K.D., **High-latitude day-time Pc1-2 continuous magnetic pulsations: a ground signature of the polar cusp and cleft projection,** *Planetary and space science,* Nov. 1991 39(11), p.1473-1491, 33 refs.

New observational and dynamical morphological results of high-latitude Pc1-2 (0.2-10 s) magnetic pulsations observed at Davis, Antarctica during solar maximum are presented. An interesting regime of Pc1-2 containing structured, semi-structured and unstructured long duration (1-10 h) magnetic pulsation bands (2-10 s), which appear to maximize in occurrence frequency and amplitude under the projection of the dayside polar cusp/cleft, is examined. An account of these emissions is given, including periods, amplitudes, duration, diurnal and seasonal distributions, polarization, power spectra and their association with magnetic activity. Moreover, a review of the literature reveals the necessity for a universal convention to clear up the apparent paradox and confused nomenclature existing in the literature on high-latitude Pc1-2 magnetic pulsations. This study concludes that Pc1-2 magnetic pulsations as reported provide a ground diagnostic estimate as to whether a station lies under the projection of the polar cusp/cleft. (Auth.)

Hansen, H.J., **High latitude unstructured Pc1 emissions generated in the vicinity of the dayside auroral oval,** *Planetary and space science,* May 1991 39(5), p.709-719, 31 refs.

Three months of ground-based recordings of high latitude dayside Pc1 magnetic variations at auroral oval stations Showa and Mawson are compared. Dynamic spectra reveal that banded unstructured Pc1 emissions (0.2-0.4 Hz) may be separated into pre-noon and post-noon activity. Although the pre-noon activity is common at Mawson, its observation at Showa is associated with low altitude cleft-like ions being present at lower than normal latitudes, i.e. 75 deg MLAT. These ions are determined from DMSP satellite observations. The Pc1 emissions at both stations are interpreted as arising from ion cyclotron waves generated in the equatorial plasmatrough region. The authors regard the dayside cleft as the free energy source of the pre-noon Pc1 activity by supplying the equatorial magnetosphere with ions. It is believed that the ion cyclotron waves enter the ionosphere within the auroral oval, poleward of Mawson and Showa, and fast Alfvén mode waves, which then arise, propagate to the stations in the F2-region ionospheric waveguide. (Auth.)

Cotton, P.D., **Propagation of mixed polarization VLF *(f* 5 (or less) kHz) radio waves in the antarctic earth-ionosphere waveguide,** *Radio science,* Sep.-Oct. 1992 27(5), p.593-610, 35 refs.

During 1986, a series of special VLF transmissions at 3 kHz and 5 kHz was made from the crossed dipole antenna at Siple Station which simulated transmissions from a single horizontal dipole at a number of different orientations. The signals excited broadside to the dipole were seen to exhibit characteristics notably different from those of signals excited along the axis of the antenna, showing a minimum in received power (the depth of the minimum decreasing for the more highly attenuating paths) and increases in apparent arrival azimuth error and elevation angle. A simple computer model for mode propagation close to 5 kHz in the Antarctic Earth-ionosphere waveguide showed that these variations were the consequence of two effects: the preferential excitation of quasi-transverse magnetic (QTM) modes along the axis of the antenna, and the lower attenuation of quasi-transverse electric (QTE) modes (with respect to QTM modes) over the antarctic ice sheet. These results have important implications for studies involving the subionospheric propagation of signals with frequencies at the lower end of the VLF band and over highly attenuating surfaces, showing that QTE modes play a significant and sometimes dominant role. (Auth. mod.)

Hayakawa, M., Shimakura, S., Kobayashi, T., Sato, N., **Study of polarization of irregular pulsations of diminishing period and their generation mechanism,** *Planetary and space science,* Aug. 1992 40(8), p.1081-1091, 30 refs.

The polarization of irregular pulsations of diminishing period (IPDPs) observed in Iceland $(L=6\text{-}7)$ and at Showa Station was investigated and some new findings have emerged: the IPDP event which has so far been considered to be one single event, normally consists of a few subelements (or slopes); and, in general, the first major element occupying the lowest frequency range is left-handed circularly polarized and the second major element in the higher frequency range is right-handed polarized. A hypothesis is presented to account for these observational facts. The first fact is indicative of the nature of successive particle injections during a substorm. The protons with higher energy during the first injection seem to encounter the bulge of the plasmasphere or plasmatail in the local time (L.T.) sector of 15-18 h and at $L=6\text{-}8$, which would result in the generation of ion cyclotron waves. Then, if one supposes that protons with lower energy are injected during a subsequent burst, they meet the plasmapause body at $L<5$ and at L.T.$>$18 h and, due to the ionospheric duct propagation over the great distance between the generation region and observing stations, the polarization in Iceland would be right-handed, which is consistent with observations. Ono, T., Satake, R., Yoshino, T., Hirasawa, T., **Energy parameters of the incident auroral electrons derived by the intensity ratio of auroral emissions,** *Antarctic record,* July 1992 36(2), p.163-180, In Japanese with English summary. 21 refs.

Average energy and total energy flux of the incident electrons in active auroras are estimated by using the intensity ratio of auroral emissions measured with a multi- channel photometer at Showa Station in 1990. Measured intensity ratios were directly compared with a result of model calculation of auroral emissions. The estimated energy parameters in active auroras showed a rapid change of average energy as well as total energy flux of electrons associated with pulsating auroras and intense auroral arcs. Average energy and total energy flux of the auroral electrons determined by the present method were consistent with the result of the previous *in situ* observations of precipitating electrons. Data analyses of active arcs in break-up phase showed that usage of the 427.8 nm emission has difficulty due to a scattering effect of the atmosphere. Usage of 670.7 nm emission in place of 427.8 nm made it possible to evaluate the energy parameters of electrons even in the vicinity of intense auroral arcs. (Auth. mod.)

Yukimatu, A., **Characteristics of 30-MHz interference noises observed by riometers,** *Antarctic record,* July 1992 36(2), p.181-202, In Japanese with English summary. 8 refs.

In 1989, when the sun was highly active, interference noise was often observed by 30 MHz riometers at Asuka and Showa stations. The noise showed a systematic diurnal and seasonal variation, and was global phenomenon because it was also seen in other riometer data at high and middle latitudes in the Northern Hemisphere. This noise was investigated in connection with ionospheric *foF2* data, geomagnetic *Kp* indices and sunspot numbers. The results are summarized as follows: interference noise consists mainly of ground radio waves reflected by the ionosphere; the interference noise occurrence shows a good correlation with *foF2;* and the noise intensity shows a tendency of decreasing on weekends, and this feature suggests that the noise is mainly of artificial origins. It is concluded that the occurrence feature of the interference noise reflects the condition of the ionosphere, and can be used as an indicator of the global electromagnetic wave environment in the HF range. Yamagishi, H., **Development of imaging riometers,** *Antarctic record,* July 1992 36(2), p.227-250, In Japanese with English summary. 12 refs.

An 8 by 8 beam imaging riometer with a view field of 180 km by 180 km, spatial resolution of 20 km, and time resolution of 1 to 4 s developed in Japan is discussed. The system design is described with emphasis on the difference from the first imaging riometer system, IRIS. This system has a unique capability of displaying absorption image on a real-time basis with the aid of QL software. The performance of the array antenna system is confirmed by simulation calculations using the galactic radio noise map at 30 MHz obtained by Cane. Procedures for absorption image forming are also described. Some of the absorption images obtained by this system are compared with optical auroral images observed at the same location at the same time. It is found that both images show a good similarity for morning-side auroras. It is concluded that the imaging riometer is a very useful tool for monitoring the auroral form when optical aurora observation is difficult. (Auth. mod.)

Sato, M., Yamagishi, H., Kato, Y., Nishino, M., **Quick-look system of auroral absorption images by imaging riometer,** *Antarctic record,* July 1992 36(2), p.251-267, In Japanese with English summary. 6 refs.

The imaging riometer of two-dimensional multi-narrow beams is a powerful radio instrument to investigate the structure of cosmic noise absorption (CNA) in the auroral ionosphere caused by the precipitation of energetic electrons. However, the instrument has the drawback of delayed-look for imaging because of the use of a large-capacity computer for data processing. A quick-look (QL) system of the imaging riometer was developed by using a personal computer. This system is able to view the CNA images in real time. Quiet day curves (QDCs) which indicate the condition of quiet ionosphere are determined from daily variations of cosmic noise intensity obtained during the initial ten days. Thereafter the QDCs are set into real-time data processing as a reference. The QL system has an advantage for real-time comparison with auroral images by the all-sky TV camera. (Auth.)

Yukimatu, A., **Observation of the upper atmosphere physics at Asuka Station by the 30th Japanese Antarctic Research Expedition in 1989,** *Antarctic record,* July 1992 36(2), p.294-309, In Japanese with English summary. 4 refs.

The JARE-30 activities at Asuka Station included year-round cosmic noise absorption measurements with a 30-MHz riometer; installation of fixed direction and tracking photometers and observation of spatial and temporal development of auroral photoemissions at various wavelengths; re-installation of an all-sky camera used during JARE-28; the installation of an all-sky SIT-TV camera for observation of auroral motions with high time resolution; installation of a digital auroral photometric-data recorder; and the recovery of the Z-component of a malfunctioning ULF induction magnetometer, allowing for observation of the 3 components of both the fluxgate and the induction magnetometers. Interesting geophysical events and auroral phenomena, due to high solar activity in 1989, are reported.

Kimura, I., Matsuo, T., Tsuda, M., Yamauchi, K., **Three dimensional ray tracing of whistler mode waves in a non-dipolar magnetosphere,** *Journal of geomagnetism and geoelectricity,* 1985 37(10), p.945-956, 8 refs.

A three dimensional ray tracing technique for whistler mode signals in the earth magnetosphere using a non-dipolar geomagnetic field model is investigated. A difficulty arising from the adoption of a general field model in ray tracing is that field line tracing is additionally required at every step of the calculation. This is because the plasma density profile such as the diffusive equilibrium model are defined along a geomagnetic field line which cannot be analytically determined in the general field model. To substantially reduce the computer time, a minimum number of field line tracings are made in advance, and in the course of ray tracing some interpolation is utilized. The error arising from such interpolations is found to be insignificant. Some examples of ray tracing are shown. The ray path of 5 kHz signals starting from the bottom of the ionosphere of the Siple (64.9S, 7.5W in geomagnetic coordinates) meridian is found to deviate eastward by about 15 deg at the apex. Skvarca, P., Cerrato, A.A., **Accurate gravity air-link between South America and the Antarctic Peninsula,** Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, [Buenos Aires, Centro Latinoamericano de Física, 1990], p.25-33, 12 refs.

In the winter of 1979, three two-way closed loops were measured with two LaCoste & Romberg geodetic gravimeters between Rio Gallegos, Argentina and Seymour I. The aim of this project was to establish an accurate gravity base station of known absolute gravity on the northern tip of the Antarctic Peninsula, required for the regional land gravity surveys carried out as part of the IAA geophysical field program, and to link with the highest possible accuracy the existing and future Antarctic Peninsula gravimetric network with the International Gravity Standardization Net 1971 (IGSN 71) via South America, due to its proximity. Discussion of the gravity measurements, calibration aspects and data reduction describes how this was accomplished.

Garcia, A., Catalan, M., Rey, J., Vila, J., Viramonte, J.G., **Magnetic anomalies on Deception I. and their integration in the study of Bransfield Strait** [Anomalías magnéticas en Deceptión y su integración en el estudio del Mar de la Flota], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, [Buenos Aires, Centro Latinoamericano de Física, 1990], p.62-71, In Spanish. Refs. p.66-67.

A magnetic survey carried out in the inner bay of Deception I. revealed the existence of a NW-SE structure with an extensive area of negative anomaly (>3000 nT), associated with a linear intrusion of high temperature material, and responsible for the latest eruptions. It is suggested that these findings are incompatible with the theory that the bay originated from the collapse of the Deception I. caldera.

(First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, [Buenos Aires, Centro Latinoamericano de Física, 1990], p.91-98, In Spanish. 5 refs.

The USAC aerosurvey program, a joint effort by the U.S., Argentina and Chile which has been in operation since Nov. 1985, is described. The information given includes number of flights (10-20/y), altitude (above 6,500 m), area covered (mostly the Drake Passage), and the program's object: to determine the geologic history of the area. Early in the program a significant difference was detected between the geomagnetic field values of international reference and the values measured during each flight. The process of selecting and analyzing the data needed to evaluate this difference, for an area between Tierra del Fuego and the Antarctic Peninsula, is described. It is concluded that, due to the difference discussed in this study, careful use of global models in the studied area is advisable.

Gianibelli, J.C., Suarez, E.K., **Characteristics of secular variations for epoch 1969.5 in antarctic and subantarctic regions** [Caracteristicas de la variacion secular para la epoca 1969.5 en las regiones antártica y subantártica], Actas de la Primera Conferencia Latinoamericana sobre Geofísica, Geodesia e Investigación Espacial Antárticas. (First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings.) Edited by A. Louro, M.A. Van Zele, and I. Velasco, [Buenos Aires, Centro Latinoamericano de Física, 1990], p.312-322, In Spanish. 11 refs.

Secular variations were determined of the components X, Y and Z of the geomagnetic field between the South Pole and latitude 43 deg 13'S, for the epochs 1965.5, 1969.5 and 1973.5. The aim was to study the anomalies of the secular variations and to establish the location of the isoporic foci related to the geomagnetic pulse which occurred in 1969.5. Results show that the component Z permits one to determine clearly the anomalous regions of the secular variation linked to the pulsation processes of the geomagnetic field.

Guterch, A., Grad, M., Janik, T., Perchuć, E., **Deep crustal structure in the region of the Antarctic Peninsula from seismic refraction modelling (next step of data discussion),** *Polish polar research,* 1990 11(3-4), p.215-239, 12 refs.

Seismic measurements, including multichannel seismic reflection and deep seismic soundings, were carried out in the region of the west coast of the Antarctic Peninsula in 1979/80, 1984/85 and 1987/88. Selected crustal sections and one and two- dimensional models of the crust for this area are discussed in detail. The thickness of the crust ranges from 30-33 km in the South Shetland Is. to 38-45 km near the coast of the Antarctic Peninsula. The crustal structure beneath the trough of Bransfield Strait is highly anomalous; a seismic discontinuity with velocities of 7.0-7.2 km/s was found at a depth of 10 to 15 km, and a second discontinuity with velocity of about 7.6 km/s was found at a depth of 20-25 km. A seismic inhomogeneity along the Deception-Penguin-Bridgeman volcanic line has also been found. A scheme for the geotectonic division and a geodynamical model of the area are discussed. Based on all experimental seismic data, it will be possible to construct a continuous geotraverse from Elephant I. across Bransfield Strait up to Adelaide I. with a total length of about 1100 km. Crustal section and seismic models along the northern segment of the geotraverse from King George I. to the Palmer Archipelago are discussed in detail. (Auth. mod.)

Larter, R.D., Barker, P.F., **Effects of ridge crest-trench interaction on Antarctic-Phoenix spreading: forces on a young subducting plate,** *Journal of geophysical research,* Nov. 10, 1991 96(B12), p.19,583-19,607, Refs. p.19,605-19,607.

Precise measurements of spreading rates on marine magnetic profiles collected to the west of the Antarctic Peninsula have enabled some consideration of the forces governing plate motion, since Antarctic-Phoenix motion has been controlled by the local rather than global force balance over the last 35 m.y. The different driving forces acting on the NE and SW parts of the Phoenix plate, as a consequence of older oceanic lithosphere at the trench in the NE, caused Antarctic—Phoenix spreading to take place about a near pole to the SW since 21 m.y. ago, and ultimately resulted in disruption of the Phoenix plate about 9 m.y. ago. Spreading rates decreased abruptly about 6 m.y. ago, probably because of E-W compression across the long transform faults bounding the Phoenix plate. However, spreading on the last three segments of the Antarctic-Phoenix Ridge continued at least until 4 m.y. ago. Either spreading stopped progressively from SW to NE, or the final stage took place about a very near pole to the SW. A magnetic quiet zone extends up to 95 km from the margin between the Tula Fracture Zone and the North Anvers Fracture Zone, and is thought to indicate that the ridge crest became buried by terrigenous sediment prior to collision. The absence of a magnetic quiet zone associated with the most recent ridge crest-trench collisions suggests a change in sedimentary regime during the late Miocene. Anomalously fast apparent spreading rates between 23 and 21 m.y. ago are thought to indicate an error in this part of the magnetic reversal time scale. (Auth. mod.)

Anderson, H.J., Zhang, J.J., **Long-period seismic radiation from the May 23, 1989 Macquarie Ridge earthquake: evidence for coseismic slip in the mantle?,** *Journal of geophysical research,* Nov. 10, 1991 96(B12), p.19,853-19,863, 44 refs.

Long-period seismic source parameters of the May 23, 1989 Macquarie Ridge earthquake are determined using a surface wave inversion procedure that incorporates detailed source-time functions obtained from shorter-period body waves. The seismic source model obtained using this method is consistent with observations of both body waves and long-period Rayleigh waves from the earthquake. The Macquarie Ridge earthquake rupture has a centroid time (28 s) and a right-lateral strike-slip fault mechanism with a rake of 175 deg on a vertical fault plane striking N38E. This mechanism is consistent with *P* wave first motions of the event. Inversions performed for various earth models demonstrate that the choice of surface wave attenuation model, in particular, affects the estimates of centroid depth and seismic moment significantly. The centroid depth, combined with the lack of resolvable directivity of the earthquake rupture, suggests that significant slip occurred beneath the Moho, which has a maximum depth of about 16 km in the epicentral region. The mantle slip component may have preferentially radiated long-period seismic energy, given the shallow centroid depths and low moments determined for the event from the shorter-period body wave observations. Grushinskiĭ, N.P., Stroev, P.A., Grushinskiĭ, A.N., IAtsenko, E.V., **Earth crust and effective topography of Antarctica** [Zemnaia kora i effektivnyĭ rel'ef Antarktidy], Gravimetricheskie i magnitnye issledovaniia na more (Gravity and magnetic investigations at sea). Edited by P.A. Stroev and A.G. Rodnikov, Moscow, MGKP AN SSSR, 1989, p.163-168, In Russian. 11 refs.

The correlation between earth crust thickness and Bouguer gravity anomalies for Antarctica are calculated by using deep seismic sounding and gravity data. A map of earth crust thickness is compiled. The effective heights of the continent are calculated and a map of effective topography is compiled. The term "effective height" means the height of the continent surface, assuming that the ice cover is condensed to the average density of the earth crust. (Auth. mod.)

Kaminuma, K., **Seismicity in Antarctica and local earthquake activities around Syowa Station, East Antarctica,** *Korean journal of polar research,* June 1991 2(1) (Special issue), Second International Symposium on Antarctic Science, Seoul, Korea, Sep. 17-18, 1990. [Proceedings], p.87-96, 19 refs.

A tripartite seismic array was established at Showa Station in 1987 for studying the local seismicity. Nine micro-earthquakes were recorded by the array during 19 months, from June 1987 to Dec. 1988, which were located in the coastal area of the antarctic continent and offshore. There are many well-developed elevated beaches and marine terraces in the coastal ice-free area of the antarctic continent. These have been formed by the relative lowering of sea level, caused by crustal uplift after deglaciation. The local micro-earthquakes seem to have been caused by tectonic stress which was accumulated by the slow-moving crustal uplift. (Auth. mod.)

Liu, C., **Paleomagnetism of the Late Cretaceous and Early Tertiary rocks from Fildes Peninsula, West Antarctica and its geotectonic significance,** *Antarctic research (Chinese edition),* 1991 3(2), p.136-143, In Chinese with English summary. 14 refs.

The paleomagnetism of 109 drill cores, collected from 5 rock units of Late Cretaceous and Early Tertiary on Fildes Peninsula, was studied. It is found that the paleomagnetic pole position of Antarctica was not at the same position as that of Australia during the 55-45 Ma period. This is interpreted as meaning that Australia was separated from Gondwanaland at its breakup during the above period, drifting southward 20-30 deg and rotating 70-80 deg westward, until it gradually arrived to its present position. It is suggested that paleolatitudinal data indicate that the area studied was covered by land glaciers at that time. The apparent polar wanderings of Antarctica through geological time are roughly worked out. (Auth. mod.)

Bozzo, E., **Magnetic reconnaissance of central Victoria Land between the Transantarctic Mountains and Terra Nova Bay, from ground surveys (1986-88),** *Società Geologica Italiana, Rome. Memorie,* 1988 Vol.43, Meeting on Earth Science in Antarctica, Siena, Sep. 27-28, 1988. Proceedings, p.165-171, With Italian summary. 11 refs.

Within the frame of the geophysical investigation of central Victoria Land, between the Transantarctic Mountains and Terra Nova Bay, a ground geomagnetic survey was performed in cooperation with other data acquisition programs of the Earth Science group. Some results of this survey, related to the compilation of the geomagnetic field maps, are presented here with a description of the main outcropping lithological units, made on the basis of the rock magnetic susceptibility data collected during the survey. A qualitative interpretation of the geomagnetic results from a geostructural standpoint is made along a transect which in a SSW-NNE direction crosses the area investigated during the first three Italian expeditions in Antarctica. (Auth.)

Damaske, D., **Regional anomalies from aeromagnetic survey in Victoria Land,** *Società Geologica Italiana, Rome. Memorie,* 1991 Vol.46, Meeting on Earth Science Investigations in Antarctica, Siena, Oct. 4-6, 1989. Proceedings, p.527-532, With Italian summary. 8 refs.

In 1984/85 an aeromagnetic survey was carried out over parts of northern Victoria Land and the western Ross Sea. In the Ross Sea area the Victoria basin shows a distinct magnetic character strongly supporting a graben-type structure within a continental crust. To the north, an abrupt change in the magnetic pattern is marked by large circular anomalies. These are connected to a magnetic unit around an elongated anomaly of large positive amplitude. This unit extends westward across the coast into the Transantarctic Mountains, possibly joining the Rennick Graben zone. Further west over the Polar Plateau the survey displays features typical for shield areas. In a second survey in 1988/89 the Rennick Graben zone itself and the border of the East Antarctica shield (or platform) in the vicinity of the lower Rennick Glacier was the main target. The results require that the shield border must be looked for west of 158E. (Auth. mod.)

Lanza, R., Manzoni, M., Miletto, M., **Paleomagnetic data from the Mt. Melbourne volcanic province, north Victoria Land, Antarctica,** *Società Geologica Italiana, Rome. Memorie,* 1991 Vol.46, Meeting on Earth Science Investigations in Antarctica, Siena, Oct. 4-6, 1989. Proceedings, p.533-541, With Italian summary. 25 refs.

The Cenozoic volcanites of the Mt. Melbourne volcanic province have been sampled at 23 sites for paleomagnetic studies during the 1985-86 Italian expedition to northern Victoria Land. After demagnetization, statistically significant TRM directions have been obtained for 21 sites, whose VGPs are scattered about a paleopole latitudinally displaced with respect to the geographic pole. A chronologic subdivision of the volcanites can be proposed on the basis of their magnetic polarities: the Mt. Melbourne cone was formed during the Brunhes Epoch of normal polarity; the southern basal part of Mt. Melbourne and a few minor satellite bodies, plugs and dykes were formed during the Matuyama Epoch of reverse polarity; the basal part of the ridge SE of Mt. Melbourne to Cape Washington belongs to the Gauss Epoch of normal polarity; the volcanites of the northernmost area, at the Burnes-Tinker Gls. confluence, having been dated at 10-12 Ma, belong to an event of reverse polarity within the anomalies 5 and 5A. (Auth. mod.)

Morelli, A., Romeo, G., Meloni, A., Palangio, P., **Permanent unmanned very-broad band seismic station in Terra Nova Bay: installation, tests and perspectives,** *Società Geologica Italiana, Rome. Memorie,* 1991 Vol.46, Meeting on Earth Science Investigations in Antarctica, Siena, Oct. 4-6, 1989. Proceedings, p.575-583, With Italian summary. 17 refs.

During the summer of 1988-89, an advanced seismic station (international code TNV) was installed and tested close to the Terra Nova Bay Italian base. The sensors comply with the very-broad band (VBB) specifications, with an instrument response flat on ground velocity in the frequency band from 8 Hz to 3 mHz, and the digitizers allow a dynamic range of 140 dB. For such a sensitive instrumentation, the installation was made inside an 8 m granite tunnel. The seismograph was kept running for a test period of about one month. Data analysis revealed a rather low background noise level, which was expected to decrease significantly after the slow mechanical settling of the sensors. A large event located in the Molucca Is. was recorded and studied. Beginning with the austral summer 1990-91 the station is expected to start continuous unmanned operation. (Auth. mod.)

Fütterer, D.K., ed, Schrems, O., ed, **Expedition ANTARKTIS-VIII of RV *Polarstern* 1989/90: Reports of Legs ANT-VIII/6-7** [Die Expedition ANTARKTIS-VIII mit FS *Polarstern* 1989/90: Bericht von den Fahrtabschnitten ANT=VIII/6-7], *Berichte zur Polarforschung,* 1991 No.90, 231p., In German with English summary.

During the sixth leg of ANT-VIII expedition the RV *Polarstern* operated between the Greenwich Meridian and 40E along the antarctic continental of Lazarev Sea, Riiser Larsen Sea and Cosmonaut Sea. A predominantly geoscientific coring and profiling program devoted to the oceanic plateaus of Gunnerus Ridge, Astrid Ridge and Queen Maud Rise was carried out. The main geophysical targets were (1) investigation of the crustal structure of the plateaus and their differences, and (2) investigation of the variation in character of the Mesozoic oceanic crust and its age. The main but still preliminary geophysical results are: (1) the oldest identified sea-floor spreading anomaly in the Riiser Larsen Sea had been anomaly M11 before the cruise; now it is M24. Thus spreading has begun at least 160 mill. years ago. (2) The Gunnerus Ridge is strongly asymmetric. The mainly weak magnetic anomalies indicate that volcanism was not an important process during its formation, which is in contrast to the formation of the Astrid Ridge. (3) The magnetic anomalies are much stronger on the Astrid Ridge and west of it than east of the Astrid Ridge and on the Gunnerus Ridge. (4) The roughness of the basement surface of the oceanic crust varies over a wide range. Leg 7 of this cruise took *Polarstern* on a biogeochemical survey of the waters of the upper South Atlantic and North Atlantic during the journey from Capetown to Bremerhaven. (Auth. mod.)

Fujii, R., **Magnetic field survey with the aid of polar patrol balloons in Antarctica,** *Nihon gakushiin. Proceedings of the Japan Academy. Series B,* Mar. 1991 67(3), p.17-21, 7 refs.

A polar patrol balloon (PPB) has accomplished a complete circumpolar flight over the Antarctic. The total intensity of the geomagnetic main field measured by an onboard magnetometer shows a satisfactory agreement with that calculated from the IGRF-model. A coincidence of the actual PPB trajectory with that calculated from wind data indicates that wind flow with the synoptic scale has little variability in the summer stratosphere in Antarctica. The novel PPB systems open new fields for the detailed observation of polar phenomena at balloon altitudes. (Auth.)

Cook, D., Davy, B., Wood, R., **Data coverage of the New Zealand and antarctic geophysical database,** *DSIR. Geophysics division. Technical report,* Aug. 1989 No.100, 50 leaves, 3 refs.

An extensive collection of digital geophysical data from the New Zealand and Ross Dependency regions is held by Geophysics Division, D.S.I.R. These data include free air and Bouguer gravity anomalies, magnetic total force anomalies and bathymetry. Marine seismic reflection and refraction data and interpretations are also stored. The limits of data coverage are 24S to 58S and 157E to 167W for the New Zealand region, and 68S to 80S and 160E to 150W for the Ross Dependency region. Figures show the data coverage for each geophysical data type. At the time of writing there were more than one million records in the Marine Database, including about 137,000 aeromagnetic and 35,000 land gravity measurements. Updates to the database occur as new data are collected. The preponderance of data at mid-1989 is in the New Zealand sector, at a ratio of about 6:1. (Auth. mod.)

Tessensohn, F., **LIRA: lithographic investigations in the Ross Sea area: a proposal for a multinational coordinated regional research programme,** New Zealand Geological Survey Report G151, Lower Hutt, NZ, DSIR Geology and Geophysics, 1991, p.61-66.

SCAR, the Scientific Committee on Antarctic Research, has established a Group of Specialists to develop international initiatives "towards acquiring the data needed for understanding the structure and evolution of the antarctic lithosphere." Under the name of ANTALITH, this group of specialists has initiated a first international geoscientific program in a central corridor across West Antarctica and into East Antarctica. The LIRA program is meant to be a complementary program under the same initiative. It concerns the area of the Ross Sea embayment and its flanks where geoscientific problems are similar to those of ANTALITH but can be treated more easily because of better infrastructure and much better access. The proposal concerns primarily the four nations with bases in this region, i.e, USA, New Zealand, Fed. Republic of Germany and Italy. LIRA is not meant to be a large funding program but rather a coordination program of the relevant national activities in this area with maximum use of existing logistic capabilities. The two main functions of LIRA are to provide a forum for the exchange of scientific ideas, plans and research results, and to promote the coordination of programs, joint ventures and sharing of logistics wherever possible. Weber, W., **Structure and development of the antarctic Earth's crust,** *Gerlands Beiträge zur Geophysik,* 1990 99(6), p.513-522, With German summary. 20 refs.

The antarctic Earth's crust consists of the Precambrian East Antarctic craton and the mobile West Antarctic block field. This block field can be divided into a Proterozoic- early Paleozoic region at the proto-Pacific margin of the East Antarctic craton and a Palaeozoic/-Meso-/Caenozoic active Pacific mobile belt. The main tectogenetic events of the antarctic crustal development coincide with those of the other southern continents. A scheme of the geological development of the main structural units is presented. (Auth.)

Kim, Y., Chung, T.W., Nam, S.H., **Marine magnetic anomalies in Bransfield Strait, Antarctica,** *Korean journal of polar research,* Dec. 1991 2(2), p.101-116, In Korean with English summary. Refs. p.114-116.

A marine magnetic survey was carried out to study the crustal structure of Bransfield Strait during the 1990/1991 summer season.

Total magnetic intensities of 8 profiles with lengths of 40-70 km across the Strait were recorded. The total survey length was about 400 km. Diurnal magnetic variation was removed from the data using the observations made on King George I. during the period, and total intensity anomalies were calculated by subtracting the IGRF (1985 coefficients). The positive anomalies commonly shown in the profiles were interpreted to be caused by two kinds of igneous bodies: a magnetic basement deduced as plutons of the Andean Intrusive Suite, and the basaltic dykes along the ridge axis. The anomalies by the basaltic dykes range from 200-2000 nT. The various shapes of the dykes are suggested from two-dimensional modeling. The dyke model suggests that the amount of extension varies. It is suggested that this regional variation of extension is possibly due to the westward migration of compressive stress: because of the small scale spreading compared to that of the ocean floor, the irregular pattern of spreading in the back arc basin may have been caused by a small change of stress field of plate motion. The mechanism of irregular spreading also can be explained by a diffusion model. (Auth. mod.)

McAdoo, D.C., Marks, K.M., **Gravity fields of the southern ocean from Geosat data,** *Journal of geophysical research,* Mar. 10, 1992 97(B3), p.3247-3260, 34 refs.

In Aug. 1990 the U.S. Navy declassified all Geodetic Mission (GM) radar altimeter data acquired by the Geosat satellite over oceanic regions south of 60S. These GM data were used in conjunction with the unclassified lower-resolution Geosat Exact Repeat Mission (ERM) altimeter data to construct high-resolution gravity fields on a 5 km grid covering the annular region of the southern ocean, which lies between 60S and 72S and encircles Antarctica. During the GM a complete mapping of the marine geoid (between 72S and 72N) was accomplished. The GM produced more densely spaced ground tracks (typically 2 or 3 km at 60S) than those of either the ERM or Seasat. The GM data were used to map the marine gravity field at a higher resolution than was previously possible using satellite altimeter data. This paper describes the techniques used to derive these gravity fields and image them. (Auth. mod.)

Kaminuma, K., Akamatsu, J., **Intermittent micro-seismic activities around Syowa Station, East Antarctica,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1991, p.1-10, 13 refs.

A tripartite seismic array was established at Showa Station in 1987 for studying the local seismicity; 10 micro-earthquakes were recorded from June 1987 to Jan. 1989. These earthquakes are located in the geological and geophysical structural boundaries of the coastal area on the antarctic continent and offshore. Four earthquakes were recorded from Feb. to Oct. 1989. The local earthquakes around Showa Station occurred intermittently. There are many well-developed elevated beaches and marine terraces in the coastal ice-free area of the antarctic continent. These have been formed by the relative lowering of sea level, caused by the crustal uplift after the deglaciation. The local micro-earthquakes seem to have been caused by the tectonic stress which had accumulated by the slow-moving crustal uplift. As local earthquakes occur intermittently, it seems that the crustal uplift is not a linear movement but an intermittent one, and the local earthquakes occur corresponding with the intermittent crustal uplift. Nogi, Y., Seama, N., Isezaki, N., Funaki, M., **Magnetic survey on Ongul Island, East Antarctica,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1991, p.11-19, 15 refs.

During the 30th Japanese Antarctic Research Expedition in 1989, geomagnetic field measurements were carried out along 2 east-west observation lines on Ongul I., and 2 east-west and 3 north-south observation lines on East Ongul I. The variations of magnetic anomalies on Ongul I. seem to correlate with the surface geology, while those on East Ongul I. do not. A model calculation showed a positive correlation of the obtained variations on Ongul I. with the geological structure and paleomagnetic results. However, widths and positions of the magnetic anomaly source model are slightly different from those of the surface geological structure. These differences provide information on how the surface geological structure extends underground. (Auth. Mod.)

Shibuya, K., **Planned explosion seismic experiments in east Queen Maud Land using a penetrator,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1991, p.29-38, 16 refs.

In order to compare crustal velocity structures of east Queen Maud Land with those of Enderby Land, large explosion seismic experiments are planned along 24E for a 400 km profile, from Breid Bay through Asuka Station and toward the Nansen Ice Field. An expendable seismograph deployable from a helicopter (antarctic penetrator) is being developed to install 40-50 seismic stations, with an elevation range from 0 to 3000 m in a limited operational schedule. The penetrator must have memories to store the digital seismic records. The recorded data have to be transmitted by radio telemetry to the central data acquisition system on the helicopter. This report briefly summarizes scientific objectives of the planned explosion experiments, and the status of the development of the antarctic penetrator. (Auth. mod.)

Asakawa, S., Kaminuma, K., Shimizu, H., **Seismic activity of Mount Erebus, Antarctica in 1989,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1991, p.39-45, 9 refs.

The annual mean number of earthquakes per day, counted at the summit station E1 of Mount Erebus, was 47 in 1989. This value indicates that the low seismic activity after the 1984 volcanic event still continued into 1989, and that it can be divided into two phases; Jan.-Aug. and Sep.-Dec. The average daily count of earthquakes for the former phase was 61, and that for the latter, 15. The hypocenters of only 12 earthquakes were determined in 1989 by using the *P* arrival time readings at 5 stations. The distribution of earthquakes in 1989 is similar to that in previous years (after the 1984 volcanic event). The average daily number of earthquakes in 1988 was 15, and the surface of the lava lake of Mount Erebus solidified in Dec. 1988. The average daily number of earthquakes in 1989 was 47, and the surface of the lava lake melted again in Dec. 1989. The seismic activity of Mount Erebus in 1989 was slightly higher than that in 1988. Takanami, T., Kitagawa, G., **Extraction of microearthquake signals recorded by the seismic network on Mt. Erebus, Ross Island, Antarctica,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.5, Tokyo, National Institute of Polar Research, 1991, p.46-52, 11 refs.

A methodology is introduced for the extraction of information from observed microearthquake waves. A model is shown for decomposition of time series into several components. In the model each component is expressed by an autoregressive model. The extraction of microearthquake signals from noise data and the decomposition of *P* and *S* wave signals are shown as an example of the adequacy of the proposed procedure. Seismic noise data recorded by the seismic network installed on the summit of Mt. Erebus is used in the procedure described. (Auth. mod.)

Bentley, C.R., **Configuration and structure of the subglacial crust,** Geology of Antarctica. Edited by R.J. Tingey, Oxford, Clarendon Press, 1991, p.335-364, Refs. p.358-364.

On the premise that the most important characteristic of the subglacial antarctic crust is the fundamental difference between East and West Antarctica, an analysis is made of the differences regarding subglacial topography, seismic refraction measurements, surface waves, body waves, and gravity. Also found of particular interest is the boundary zone between East and West Antarctica; the work carried out in this region, and other regions of interest, is reviewed. It is noted that East Antarctica is truly continental, whereas West Antarctica is some kind of borderland, the geological nature of which is being vigorously debated; that the mean thickness of its crust is about 30 km, compared with about 40 km in East Antarctica; and that the boundary between the two Antarcticas is abrupt, which is interpreted as indicating that the change in crustal thickness is also sudden.

Anderson, D.L., Tanimoto, T., Zhang, Y., **Plate tectonics and hotspots: the third dimension,** *Science,* June 19,1992 256(5064), p.1645-1651, Numerous refs.

High-resolution seismic tomographic models of the upper mantle provide powerful new constraints on theories of plate tectonics and hotspots. Midocean ridges have extremely low seismic velocities to a depth of 100 km. These low velocities imply partial melting. At greater depths, low-velocity and high-velocity anomalies record, respectively, previous positions of migrating ridges and trenches. Extensional, rifting, and hotspot regions have deep (>200 km) low-velocity anomalies. The upper mantle is characterized by vast domains of high temperature rather than small regions surrounding hotspots; the asthenosphere is not homogeneous or isothermal. Extensive magmatism requires a combination of hot upper mantle and suitable lithospheric conditions. High-velocity regions of the upper 200 km of the mantle correlate with Archean cratons. The range of this global study extends to 60S for most parameters, and to the antarctic coast for some. (Auth. mod.)

Das, S., **Reactivation of an oceanic fracture by the Macquarie Ridge earthquake of 1989,** *Nature,* May 14, 1992 357(6374), p.150-153, 15 refs.

Theoretical calculations show that the occurrence of an earthquake leads to regions of increased shear stress on both sides of the ruptured fault. If this stress increase is sufficiently large, or if neighboring faults are close to their failure stress, the result may be triggering of earthquakes on pre-existing faults in the region. A search for this effect produced only a few examples, all in continental areas, where clusters of aftershocks were located in the regions of increased stress. The linear dimensions of these clusters were generally less than 20 km, and less than one-half of the fault length that ruptured in the main shock. An example of this phenomenon is reported here in which the fault that is reactivated is a nearly 175 km-long segment of an oceanic fracture, and its length is comparable to that of the main shock, the 1989 Macquarie Ridge earthquake. Nagasaka, K., Kaminuma, K., Shibuya, K., **Seismological observations by a three-component broadband digital seismograph at Syowa Station, Antarctica,** *Antarctic record,* Nov. 1991 35(3), p.335-354, In Japanese with English summary. 6 refs.

A three-component broadband STS (Streckeisen seismometer) seismograph was installed at Showa Station in 1989, to obtain a precise (digital) seismic record for the study of the earth's interior and earthquakes. The STS observation system at Showa Station is introduced and some examples of digital seismogram are shown. The STS system has two different outputs, BRB (Broad-Band: 0.1-20 s/0.1-360 S) and LP (Long-Period: longer than 20 s), with a dynamic range of at least 120 dB. Seismic signals are recorded in digital form together with analog seismograms for monitoring. The BRB output is currently recorded with a long-term thermal pen recorder and the digital recording system by use of personal computers, while the LP output is recorded with a pen recorder and cassette logger. Well recorded events are compiled into floppy disks from the digital recording system approximately once a week. The digital records were transmitted successfully to the National Institute of Polar Research, Japan, via the satellite telecommunications system. (Auth.)

Zipfel, J., Wörner, G., **Four- and five-phase peridotites from a continental rift system: evidence for upper mantle uplift and cooling at the Ross Sea margin (Antarctica),** *Contributions to mineralogy and petrology,* 1992 111(1), p.24-36, 44 refs.

Based on petrographical and geothermobarometric results and diffusion arguments, a four stage model is developed for the evolution of the upper mantle beneath the margin of the Ross Rift: (1) adiabatic uplift into the plagioclase/spinel-peridotite field; (2) subsequent cooling below the blocking temperature (800 C) of the 2 px-thermometer to about 600 C as indicated by low Ca in olivine cores; followed by (3) reheating to 760 C as suggested by zonation to high calcium concentrations of up to 200 ppm in olivine rims. Calcium concentrations of up to 800 ppm were measured in one ELZ-olivine in the outermost rim (10 micron) reflecting (4) a last heating event during transport and ascent in the basanitic host magma. Timing for the latter two stages has been roughly calculated from Ca-diffusivities in olivine. A minimum duration of 1200 to a few million years is indicated for stage 3 and 90 h to 22-23 days for stage 4, respectively. This timing of events correlates to increased mantle temperatures for the duration of magmatic activity of the Mt. Melbourne Volcanic Field and the short-term transport in host magmas. The results also indicate that anomalous shallow mantle exists at the transition from the Ross Rift into the uplifted Transantarctic Mountains. (Auth.)

Liu, J.H., **Note on the crustal structure between the Antarctic Peninsula and the East Antarctic Craton across the shelf of the southern Weddell Sea,** *Antarctic research (Chinese edition),* Mar. 1992 4(1), p.23-28, In Chinese with English summary. 13 refs.

On the basis of analysis of gravity data across the shelf between the Antarctic Peninsula and the East Antarctic Craton, constrained by magnetic depth estimates and seismic refraction data, this paper deals with the crustal structure of the southern Weddell Sea and its evolution. The water depth along the cross-section varies from 400 m to 600 m with no abrupt changes, except in the southeast where the water is nearly 1000 m deep. A geophysical survey indicated that there is a large sedimentary basin under the Ronne-Filchner Ice Shelf, the depocenter being in the middle of the basin with a maximum sediment thickness of 10 km. In Airy-type isostatic equilibrium, a possible 2-D model for the crustal structure under the shelf of the southern Weddell Sea is proposed. A particular feature of the model is the requirement for a thinned crust below the sedimentary basin. The younger part of the sedimentary section does not display significant evidence of extensional tectonics. It is suggested that extension of the crust must therefore have occurred at an early stage of basin evolution, or the upper part of the sedimentary section is very young. (Auth. mod.)

Acosta, J., **Magnetic anomalies in southern Bransfield Strait** [Anomalías magnéticas al sur del mar de Bransfield], Actas del tercer Symposium Español de Estudios Antárticos. Gredos, 3 al 5 de octubre de 1989. (Spanish Symposium on Antarctic Studies, 3rd, Gredos, Oct. 3-5, 1989. Proceedings), [Madrid], Comisión Interministerial de Ciencia y Tecnología, [1990], p.254-257, In Spanish with English summary.

During the 1987-1988 and 1988-1989 antarctic expeditions, two digital magnetometers were installed on the South Shetland Is. The one on Livingston I. has three components: protons, F, and flux gate D and I; the one on Deception I. consists of protons recording total force (F). Both instruments were used in the summer seasons in magnetic surveys of the area. Results on land and magnetic profiles obtained at sea are discussed and illustrated.

Acosta, J., Catalan, M., Herranz, P., Sanz, J.L., **Seismic profiles of the South Shetland Islands and the Bransfield Strait. Recent structure and dynamics** [Perfiles sísmicos en las Shetland del Sur y estrecho de Bransfield. Estructura y dinamica reciente], Actas del tercer Symposium Español de Estudios Antárticos. Gredos, 3 al 5 de octubre de 1989. (Spanish Symposium on Antarctic Studies, 3rd, Gredos, Oct. 3-5, 1989. Proceedings), [Madrid], Comisión Interministerial de Ciencia y Tecnología, [1990], p.281-296, In Spanish with English summary. 20 refs.

Shallow seismic profiling and geomagnetic total field records were conducted in Bransfield Strait and the continental shelf of the South Shetland Is. during the Exantarte 88-89 expedition. The location of seismic profiles was partly determined by sea ice conditions. The seismic records were obtained by a 4 Kj sparker, and recorded on an EPC analog recorder simultaneously at 1 and 2 seconds scale, after filtration between 80 Hz and 600 Hz. Geomagnetic profiles were obtained with a marine proton magnetometer working simultaneously with sparker profiling. Seismic profiles show a ridge lineation following a Deception I.-Penguin I.-Bridgeman I. line, with outcrop mountains associated with high geomagnetic anomalies. In the Bransfield Strait central area, a sedimentary prism with normal faulting, sea floor scarps, offset seismic reflectors, sea floor morphology and intrusive volcanic bodies, indicate a recent seismically active faulting zone associated with a rifting area. (Auth. mod.)

Grad, M., Guterch, A., Sroda, P., **Upper crustal structure of Deception Island area, Bransfield Strait, West Antarctica,** *Antarctic science,* Dec. 1992 4(4), p.469-476, Refs. p.475-476.

Results of seismic refraction investigations of the upper crustal structure in the area of Deception I, carried out in 1979-1980 and 1987-1988, are discussed. In the caldera and immediate vicinity of Deception I. a layer of unconsolidated and poorly consolidated young sediments of 1.9-2.2 km/s P-wave velocity was found. Velocities of 4.1-4.3 km/s were found in the depth interval from 0.6-1.3 to about 3 km. Lateral differences in upper crustal structure between the southeastern and western sectors were identified. In the region between Deception and Livingston islands an inclined boundary with a velocity of about 6.1 km/s occurs. A deep fault zone dividing crustal blocks beneath Deception I. is associated with a prominent volcanic line within Bransfield Strait, extending between Deception and Bridgeman islands. (Auth. mod.)

Shibuya, K., **Status report for the development of the antarctic penetrator: No.2. 1990-year program,** *Antarctic record,* July 1992 36(2), p.310-340, In Japanese with English summary. For program No.1 see 19L-44414 or 45-3397. 7 refs.

The Global Positioning System (GPS) differential positioning test on the antarctic penetrator was made at the Aoyama Pasture, Ishikari-Tobetsu-machi, Hokkaido. The reference GPS receiving site was chosen in Hakodate, 200 km southwest of the Aoyama Pasture, taking the seismic exploration experiments on the Sör Rondane Mountains 400 km profile in Antarctica into consideration. Three dummy penetrators were dropped twice by changing the release height in the range of 160-1000 m above the ground. Six impact positions of the deployed penetrators were determined by a relative carrier phase measurement to an accuracy of 0.1 m, and the position results were compared with the post-processed GPS differential positions. When 10-20 s duration GPS position data could be acquired at an interval of 1 s before and after the release time (1 s accuracy to UTC) of the penetrator, the estimated impact position by tracing the falling trajectory was found to be within 30 m offset from the actual impact location determined by the relative carrier phase measurement. Weber, M., **Late Quaternary sedimentation at the continental margin of the southeastern Weddell Sea, Antarctica** [Spätquartäre Sedimentation am Kontinentalrand des südöstlichen Weddellmeeres, Antarktis], *Berichte zur Polarforschung,* 1992 No.109, 165p., In German with English summary. Refs. p.113-123.

During four Polarstern expeditions geological samples were retrieved on the continental margin in the southeastern Weddell Sea east of Crary Fan for sedimentological studies. High resolution seismic reflection data were also collected along 5.000 profile kilometer for interpretation. Detailed sedimentological analyses were carried out on 22 surface samples as well as on sediment cores from three sites. In addition to a general description of the sediments and structural investigations on X-radiographs, the contents of carbonate and organic carbon, the grain-size and component distribution, the distribution of minerals in the clay fraction and physical properties such as water content, porosity, wet bulk density, dry density and magnetic susceptibility were determined. The stratigraphy is based on C-14 dating, the distribution of stable oxygen and carbon isotopes in the planktonic foraminifera *Neogloboquadrina pachyderma,* and on paleomagnetic measurements. Details of the analyses, measurements, and time periods of these properties are given. (Auth. mod.)

M. POLITICAL GEOGRAPHY

M-45107

Herber, B.P., **International public goods of Antarctica: a new politico-economic regime for the world's seventh continent,** International Institute of Public Finance, 44th Congress, Istanbul, 1988. Proceedings, edited by V. Tanzi, Detroit, MI, Wayne State University Press, 1990, p.263-276, With French summary. 25 refs.

DLC HJ113.I73 1988

Recent decades have witnessed a growing scholarly interest in public goods. Much of this attention, however, has been directed toward collective consumption within sovereign national political jurisdictions. As a result, the concept of international public goods, in which collective consumption benefits are shared among sovereign nations, has generally been neglected. The purpose of the present paper is to draw further attention to international collective consumption by considering a particular international public goods case which, in itself, has been largely neglected by economists despite the importance which it portends for the world community. That case encompasses the international treaty which, since 1961, has provided the politico-economic framework for governing the world's seventh continent, Antarctica, and the unique international public goods which this treaty has generated. In Section II, some of the theoretical peculiarities generic to international public goods are identified. The Antarctic Treaty and its international public goods are then described in Section III. Changing treaty parameters pointing to the likelihood of a new governance regime, as well as major regime alternatives, are considered in Section IV. An assessement of the future of antarctic public goods is provided in Section V in relationship to the selection process for a new governance regime. (Auth.)

Machowski, J., **Right to freedom of research under the Antarctic Treaty System,** *Polish polar research,* 1990 11(3-4), p.419-434, 35 refs.

Freedom of research is one of the fundamental principles upon which the Antarctic Treaty System (ATS) was founded. Its scope is defined by the limitations imposed by relevant legal rules. They provide, among others, for prohibition of scientific investigation of military character and declare that no activities—including research—shall constitute a basis for territorial claims in Antarctica. Of particular importance are limitations imposed on freedom of research for the benefit of environmental protection. But, contrary to some views, most scholars consider that the freedom of research and the protection of the environment and ecosystems in Antarctica are equally important principles central to the whole ATS. They are inter-dependent and neither one should be attributed priority over the other. In the best interests of science, antarctic research needs to be controlled to the necessary minimum of environmental impact and risk. (Auth.)

Herber, B.P., **Common heritage principle: Antarctica and the developing nations,** *American journal of economics and sociology,* Oct. 1991 50(4), p.391-406, 33 refs.

An effort is underway to apply the common heritage principle to certain unique global resources while promoting economic development. Under this precept, property rights to such resources are said to belong to all nations and their citizens rather than being subject to national sovereignty. The doctrine is examined in theory and as applied in the outer space and law of the sea treaties. Its possible application to Antarctica is explored in relationship to the Antarctic Treaty System (ATS) which is now considering a minerals regime for the continent. Assessing the international political situation suggests the powerful bloc of ATS nations will ignore the common heritage principle. However, a different outcome is possible, given a convergence of the antarctic mining and global atmospheric issues of the greenhouse and ozone varieties. Under this scenario, the global atmosphere and Antarctica would be common property resources whose property rights are owned by all nations. (Auth.)

Almond, H.H., Jr., **Antarctica and outer space: emerging perspectives and perceptions,** From Antarctica to outer space: life in isolation and confinement, edited by A.A. Harrison, Y.A. Clearwater and C.P. McKay, New York, Springer-Verlag, [1990], p.373-382.

DLC Q180.55.P75F76

It is pointed out that competition for territory and resources in previously uninhabited areas provides a basis for international friction and conflict. Some of the pitfalls and loopholes that exist in antarctic and space law are described, and ways in which international agreements and treaties in Antarctica can be improved and extended to regulate people and nations in outer space are discussed.

Caflisch, L., **Interaction of science and politics in the field of international relations: the case of Antarctica,** *Polar record,* Apr. 1992 28(165), p.159-162, 4 refs.

This paper is concerned with the interplay between science and politics when dealing with the formation and implementation of international rules of conduct for the Antarctic. After examining the behavior of the main political actors on the antarctic scene, i.e. the conduct of sovereign states and of international inter-governmental or non-governmental organizations, the author concludes that SCAR provides the indispensable communication link between science and politics in Antarctica.

U.S. National Science Foundation, **Antarctic journal of the United States, Vol.26, No.4,** Washington, D.C., 1991, 23p.

Developing a comprehensive system to ensure the protection of the antarctic environment has been a focus of discussion among the Antarctic Treaty Consultative Parties (ATCP) during 2 years of special meetings. On Oct. 4, 1991, representatives of the 26 consultative parties concluded their negotiations and adopted by consensus the Protocol on Environmental Protection to the Antarctic Treaty. This pivotal agreement, which builds on the Antarctic Treaty and related agreements, extends and improves the effectiveness of the treaty system to preserve the antarctic environment. The protocol designates Antarctica as a natural reserve, devoted to peace and science. Besides prohibiting all mineral-resource activities (except those associated with scientific investigations), the protocol sets forth general principles, which apply to any human activity in Antarctica, to ensure the preservation of the continent's environment, as well as its dependent and associated ecosystems. Although the full text of the protocol and its annexes (but not the three appendixes) follow this article, some of its essential components are described here. Included among the essential components are: environmental principles and impact assessment; compliance with the protocol; committee for environmental protection; inspections and reporting; dispute settlement; conservation of fauna and flora; waste disposal and management at the stations and in the field; prevention of marine pollution; and area protection and management.

Inderbitzen, A.L., **Convention on the regulation of antarctic mineral resource activities,** Pacific/Asia Offshore Mechanics Symposium, First, Seoul, Korea, June 24-28, 1990. Proceedings, Vol.1. Edited by J.S. Chung et al, Golden, CO, International Society of Offshore and Polar Engineers, 1990, p.39-43, 3 refs.

DLC TC1665.P34 1990

After six years of negotiation the Antarctic Treaty Consultative Parties reached agreement on a Convention for the Regulation of Antarctic Mineral Resource Activities. The agreement is not a code of detailed regulations, but rather a set of standards and criteria upon which decisions about possible future antarctic mineral resource activities must be based. Five institutions are established to administer the entire process. Activities must proceed in three distinct stages: prospecting, exploration and development. No activity can proceed beyond prospecting unless there is a unanimous decision by the Commission to open an area for exploration and possible development. Decisions for mineral resource activity cannot be made until there is adequate information to make informed judgements on the possible environmental impacts. No activity can take place unless the technology and procedures are available to meet the strict standards of the treaty; to monitor the impact of the activity; and to respond effectively to accidents. The agreement contains many restraints and controls on mineral resource activities. Any operation that poses an environmental threat can be shut down. Although the future of the agreement is uncertain it will be many years before there is any significant mineral resource activity in Antarctica, if ever. (Auth. mod.)

Rigg, K., Hemmings, A., Mathias, M., **Protecting the antarctic environment by limiting human presence and activities: the case for a world park,** Pacific/Asia Offshore Mechanics Symposium, First, Seoul, Korea, June 24-28, 1990. Proceedings, Vol.1. Edited by J.S. Chung et al, Golden, CO, International Society of Offshore and Polar Engineers, 1990, p.51-58, 42 refs.

DLC TC1665.P34 1990

The refusal of several Antarctic Treaty Parties in 1989 to ratify the Convention on the Regulation of Antarctic Mineral Resources Activity (CRAMRA), which had been signed in June, 1988 by all Parties, emphasized the difficulty in attaining international consensus on regulation of mineral exploitation of the antarctic environment. This paper discusses a radical alternative to the assumption that such exploitation can be rendered consistent with fundamental environmental protection, by examining the proposition that Antarctica be converted to a World Park. This program would effectively prohibit all industrial activity on the antarctic continent, and would advance the protection of this vast ecosystem as the primary purpose of human presence in Antarctica.

Moreano, H., **Ecuadorian national antarctic policy and mechanisms for its application** [La política nacional del Ecuador para asuntos antárticos y sus mecanismos de aplicación], *Acta antártica ecuatoriana,* 1990 Vol.1, p.87-90, In Spanish with English summary. 2 refs.

It is felt that the three Ecuadorian Antarctic Expeditions and the admission of Ecuador, by consensus, as a consultative Member of the Antarctic Treaty, are facts through which the country has made real its interest in Antarctica, and that future geopolitical and scientific activities should be directed to enhance the Ecuadorian presence in that continent, framed within a solid national policy. This paper establishes a concept of the national policy in antarctic matters within the context of the Antarctic Treaty System. Mechanisms to apply such a policy through the Ecuadorian Antarctic Program and the National Scientific Committee on Antarctic Research are considered. (Auth.)

Yoshida, Y., **Protocol on Environmental Protection to the Antarctic Treaty and its Annexes. International Agreement on the Comprehensive Measures for the Protection of Antarctic Environment and Ecosystems,** *Antarctic record,* Mar. 1992 36(1), p.116-161, In Japanese with English summary. 2 refs.

According to Recommendation XV-1 adopted at the 15th Antarctic Treaty Consultative Meeting in Oct. 1989, the elaboration of the Comprehensive Measures for the Protection of the Antarctic Environment and Dependent and Associated Ecosystems was to be undertaken by the Antarctic Treaty Consultative Parties (ATCP) at Viña del Mar in Chile in Nov. 1990. The 5 meetings, one at Viña del Mar and 4 at Madrid, were held as the 11th Antarctic Treaty Special Consultative Meeting. The meetings were attended also by non-Consultative Antarctic Treaty Parties and intergovernmental and non-governmental organizations such as CCAMLR, IOC, SCAR, IUCN, ASOC, etc., as observers. The Protocol on Environmental Protection to the Antarctic Treaty and its 4 annexes were adopted by the ATCP on Oct. 4, 1991. Part of the process of negotiations and the background of the adopted instruments are reported. The authentic texts of Protocol and its Annexes in English and their provisional Japanese translation by the author are appended. (Auth.)

Lanker, R.G., **Competing claims among Argentina, Chile, and Great Britain in the Antarctic: economic and geopolitical undercurrents,** Monterey, Naval Postgraduate School, 1991, 120p., ADA-246 472, M.A. thesis. Refs. p.117-119.

The antarctic continent holds a vast economic potential in both renewable and non-renewable resources. Therefore, the sovereignty of the continent, and in particular the Antarctic Peninsula and Weddell Sea areas, has been a key issue between Argentina and Chile for hundreds of years. Currently these two nations, along with Great Britain, have overlapping claims in the region. This thesis examines the geopolitical and historical claims of these and other nations, along with the current and potential mechanisms that are designed to regulate the region. It also evaluates the potential for conflict in the future over the disputed region and examines current U.S. interests. It concludes that the United States should make every effort to maintain the current Antarctic Treaty System. (Auth.)

M-46951

Van Bennekom, S., **New regime to protect the antarctic environment,** *Leiden journal of international law,* Feb. 1992 5(1), p.33-52, 67 refs.

On Oct. 4, 1991 the parties to the Antarctic Treaty adopted the Protocol on Environmental Protection to the Antarctic Treaty. This Protocol contains a prohibition for fifty years on all exploration and exploitation of mineral resources in the Antarctic. The Wellington Convention, which was adopted in 1988 and was intended to regulate the exploitation of minerals, can now be considered dead and buried. Apart from the prohibition on minerals activities, the Protocol sets out a number of rules and regulations to control the activities in Antarctica in a more stringent way than before. This article analyzes the Protocol and compares the severity of the rules with the degree of control in the Wellington Convention. It seems likely that states are less willing to accept heavy bureaucratic measures if the road to minerals development is cut off. For issues like dispute settlement, environmental impact assessment, the creation of new institutions and liability, the articles in the Protocol are compared with the corresponding articles of the Minerals Convention. This article also contains some suggestions on how the current plans to protect the antarctic environment can be improved. (Auth.)

U.S. Congress. House. Committee on Interior and Insular Affairs. Subcommittee on Insular and International Affairs, **Hearing on H.R. 4515: Antarctica world park and protection act of 1990,** Washington, D.C., U.S. Government Printing Office, 1991, 306p. Serial No. 101-84.

This bill requires the Secretary of the Interior to prepare a plan for the establishment of a world park in Antarctica. To assist in judging the wisdom of such a course, testimony was taken and questions were asked of several persons knowledgeable in antarctic affairs. Will Segar, leader of the recent TransAntarctica Expedition, spoke favorably of the bill. A panel consisting of representatives of the Dept. of the Interior, Dept. of State, and the National Science Foundation, spoke against the bill, primarily because the international character of the continent does not lend itself to unilateral actions such as this. Additionally, the panel emphasized, with examples, that the Antarctic Treaty provides an experienced vehicle for the protection of the antarctic environment, aided by an antarctic environmental policy revitalized by $30 million dedicated to environmental remedial action at the U.S. bases. A second panel, with representatives from the Wildlife Program, Environmental Defense Fund and the Antarctica Project and Southern Ocean Coalition, supports H.R. 4514, particularly because it bans all mining activity in Antarctica.

M-47255

U.S. Congress. Senate. Committee on Foreign Relations, **[Hearing on the Protocol on Environmental Protection to the Antarctic Treaty (Treaty Doc. 102-22)],** Washington, D.C., U.S. Government Printing Office, 1992, 37p.

At this brief Hearing on May 4, 1992, the leader of the U.S. negotiating delegation in Madrid provided a summary of the terms of the Protocol, how it is formatted, what entities and procedures are established by the 26 ATCPs, and when it will enter into force. Twenty-three of the twenty-six ATCPs signed the Protocol on Oct. 4, 1991; from Oct. 5, 1991 until Oct. 3, 1992 it remained open for signature in Washington, D.C. Representatives from the Antarctica Project and from Greenpeace testified in favor of the Protocol and urged the Senate to give its advice and consent to the document.

M-47256

U.S. Congress. Senate. Committee on Commerce, Science, and Transportation. Subcommittee on Science, Technology, and Space, **[Hearing on monitoring the arctic and antarctic environments],** Washington, D.C., U.S. Government Printing Office, 1992, 119p.

The Hearing convened on May 13, 1991 and had as one of its major goals the comparison of the U.S. research effort in Antarctica and the Arctic. A second goal was to discover if the compromise protocol on antarctic minerals activities, negotiated in Madrid in 1991, accurately reflected the thoughts of the Congress on what those activities should be. A third goal was to gain information on the status of the ice cover with its annual and seasonal variations in both polar regions and to interpret the changes on a global basis.

M-47257

U.S. Congress. Senate. Committee on Foreign Relations, **[Hearing on Antarctica legislation: S. 2575, S.J. Res. 206, and S. Res. 186],** Washington, D.C., U.S. Government Printing Office, 1990, 114p.

The legislation cited in the title is designed to emphasize the need for increased protection for the antarctic environment and to strengthen the standards of that protection. The bill and resolutions are deemed necessary as substitutes for CRAMRA which at the time of the Hearing had lost the required ATCP consensual agreement to bring it into force. Knowledgeable individuals from the State Department, National Science Foundation,and the Senate testified as to their concerns with the form and the requirements of the proposed legislation and how it would aid or hinder other antarctic negotiations to be undertaken later with the ATCPs. There was much discussion on the difference between the research methods in geophysical studies and those of mineral explorations; it appeared that, basically, the difference lay in what the entities involved called it, and this in turn determined whether the results would be identified as proprietary data and not shared, or scientific data and shared.

M-47258
U.S. Congress. House. Committee on Merchant Marine and Fisheries. Subcommittee on Fisheries and Wildlife Conservation and the Environment. Subcommittee on Oceanography and Great Lakes. Subcommittee on the Coast Guard and Navigation, **Hearing on H.R. 3977, a bill to protect and conserve the continent of Antarctica, and for other purposes [and on] H.R. 4210, a bill to amend the Antarctic Conservation Act of 1978 to protect the environment of Antarctica, and for other purposes,** Washington, D.C., U.S. Government Printing Office, 1990, 206p.

The Hearing convened on June 26, 1990 and had as its purpose to provide for increased emphasis on the protection of the antarctic environment *vis á vis* United States activities there. It was the intent to strengthen the Antarctic Conservation Act of 1978 by amending it to broaden its scope and to correct defects resulting from increased activity in Antarctica. These flaws are specified as increases in the number of research stations, poor waste disposal, oil spills, and increased tourism; deficiencies in the CRAMRA minerals agreement; increased risks of oil spills and degrading of the environment; and over-exploiting fish stocks. A series of prohibited acts is set forth along with pertinent definitions, applicability, and penalties to be assessed for violations. Testimony was given by knowledgeable persons both in and out of government, including some of those most closely associated with Antarctica, its environment and the research programs there.

M-47259
U.S. Congress. House. Committee on Merchant Marine and Fisheries. Subcommittee on Oceanography, Great Lakes and the Outer Continental Shelf. Subcommittee on the Coast Guard and Navigation. Subcommittee on Fisheries and Wildlife Conservation and the Environment, **Hearing on H.R. 5459, a bill to implement the protocol on environmental protection to the Antarctic Treaty, and for other purposes,** Washington, D.C., U.S. Government Printing Office, 1992, 237p.

The Hearing convened on June 30, 1992, having for its principal focus a better understanding of the Protocol to the Antarctic Treaty negotiated in Madrid and adopted on Oct. 4, 1991, and to compare it with the draft of implementing legislation. To that end, oral and written statements were taken from 17 witnesses. Sets of written questions from the Committees and responses from the witnesses were admitted to the record along with a section-by-section analysis of H.R 5459. Additionally, the 17 witnesses, who represented a broad spectrum of government and private interests, and who are deeply involved in antarctic activities, were questioned at some length to ascertain their opinions as to the efficacy of the Protocol and to get some idea of the thinking of antarctic-knowledgeable persons as to what direction the enabling legislation should take.

M-47295
U.S. Congress. House. Committee on Foreign Affairs. Subcommittee on Human Rights and International Organizations, **Hearing and markup on Title II of H.R. 2984, H. Con. Res. 287 and H. Con. Res. 227,** Washington, D.C., Government Printing Office, 1990, 217p.

The Hearing convened in two sessions, May 2 and July 19, 1990. At the first gathering, representatives from these groups testified: the Cousteau Foundation; Environmental Policy Institute, Friends of the Earth, and Oceanic Society; World Resources Institute; and Greenpeace. The primary focus of the Hearing was on the antarctic Minerals Convention and its relationship to the protection of the antarctic environment. Three of the witnesses spoke with varying degrees of intensity against the Convention. The witness from the World Resources Institute pointed out several positive aspects of the Convention. At the July 19 meeting, representatives of the Administration testified, speaking in favor of the Minerals Convention (CRAMRA, Wellington Convention), emphasizing the stringent conditions that would apply to any mineral seeker and the consensus needed from the ATCPs before any exploration or extraction could occur.

M-47296
U.S. Congress. House. Committee on Science, Space, and Technology. Subcommittee on Science, Research and Technology, **Hearing [on Antarctic minerals policy, July 12, 1990],** Washington, D.C., U.S. Government Printing Office, 1990, 171p.

The focus of the Hearing was on the Convention on Regulation of Antarctic Mineral Resource Activities (CRAMRA) and the controversy which developed after it was sent to the CP nations for acceptance. Following brief opening statements by members of the Committee or Subcommittees, testimony was taken from representatives from the Office of Technology Assessment, Congressional Research Service (Library of Congress), Department of State, National Science Foundation, Sierra Club International, the Antarctica Project, University of Texas (a Senior Research Scientist), and the University of Wisconsin (a Professor of Geophysics). All witnesses agreed that the antarctic environment must be especially protected because of the global influence Antarctica wields over the habitability of the planet. The instruments and methods needed to ensure that protection produced the conflicting viewpoints. Those favoring a complete ban on all mineral activity interpret CRAMRA as opening the door to minerals development and mining activity. Those who support CRAMRA believe it opens the door only under very special conditions and stringent pre-conditions requiring consensus among all ATCPs. They also believe that banning all mineral activity would preclude research in geophysics because the methods used by minerals explorers are the same methods used by geophysics researchers and that tool would thereby be denied them.

Culture of rhizoidal tubers on an aquatic moss in the lakes near the Syowa Station area, Antarctica [1992, eng] **B-47034**

Jacka, F.
Influence of geomagnetic activity on the upper mesosphere/lower thermosphere in the auroral zone. I. Vertical winds [1991, eng] **K-45391**
Influence of geomagnetic activity on the upper mesosphere/lower thermosphere in the auroral zone. II. Horizontal winds [1991, eng] **K-45392**
Ring effect in the sodium D2 Fraunhofer line of day skylight over Mawson, Antarctica [1992, eng] **K-46689**

Jacka, T.H.
Antarctic field study of the rheology and movement of a sea-ice floe aggregate [1991, eng] **F-45353**
Detection of temperature and sea ice extent changes in the Antarctic and southern ocean [1991, eng] **F-45984**

Jacob, A.
Physiological responses of the antarctic green alga *Prasiola crispa* ssp. *antarctica* to salinity stress [1991, eng] **B-45402**
Physiology and ultrastructure of the antarctic green alga *Prasiola crispa* ssp. *antarctica* subjected to osmotic stress and desiccation [1992, ger] **B-46355**
Changes in the ultrastructure of *Prasiola crispa* ssp. *antarctica* under salinity stress [1992, eng] **B-46574**

Jacobel, R.W.
Studies of internal layering and bedrock topography on ice stream C, West Antarctica [1990, eng] **F-45915**

Jacobs, J.
Structural evolution and cooling history of the Heimefrontfjella Mountains (Western Dronning Maud Land / Antarctica) [1991, ger] **E-45487**

Jacobs, S.S.
Voyage of iceberg B-9 [1992, eng] **F-45538**
Is the antarctic ice sheet growing [1992, eng] **F-47363**
On the nature and significance of the Antarctic Slope Front [1991, eng] **J-45537**
RACER: hydrography of the surface waters during the spring bloom in the Gerlache Strait [1990, eng] **J-46011**
Chlorofluorocarbon evidence for rapid ventilation of the Ross Sea [1991, eng] **J-46915**

Jacques, G.
Is the concept of a new production—regenerated production valid for the southern ocean [1991, eng] **B-46226**

Jaenicke, R.
Condensation nuclei measurements at the Georg von Neumayer Station (F.R.G.), coastal Antarctica [1991, eng] **I-46591**
Condensation nuclei at the German antarctic station "Georg von Neumayer" [1992, eng] **I-47245**

Jahnke, J.
Growth and productivity of the psychrophilic marine diatoms *Thalassiosira antarctica* Comber and *Nitzschia frigida* Grunow in batch cultures at temperatures below the freezing point of sea water [1992, eng] **B-46833**

Jamous, D.
Distribution of helium-3 in the deep western and southern Indian Ocean [1992, eng] **J-45692**
He-3 and chlorofluorocarbons (CFC) in the southern ocean: tracers of water masses [1991, eng] **J-46217**

Jandacek, R.J.
Positional analyses of triacylglycerol fatty acids in the milk fat of the antarctic fur seal *(Arctocephalus gazella)* [1992, eng] **B-46918**

Janiec, K.
  Further note on *Branchinecta gaini* (Daday, 1910) population from the region of the H. Arctowski Station (King George Island, South Shetland Islands) [1991, eng] **B-45738**
Janik, T.
  Lithospheric transect, Antarctic Peninsula—South Shetland Islands, West Antarctica [1990, eng] **E-45148**
  Deep crustal structure in the region of the Antarctic Peninsula from seismic refraction modelling (next step of data discussion) [1990, eng] **L-45147**
Jansen, E.
  Deglaciation, impact on ocean circulation [1991, eng] **J-45473**
Janssen, J.
  Comparisons in the use of the lateral line for detecting prey by notothenioids and sculpins [1990, eng] **B-46278**
Japanese Antarctic Research Expedition
  Antarctic meteorological data. Vol.30. Meteorological data at the Syowa Station in 1989 [1992, eng] **I-46899**
  Antarctic meteorological data. Vol.31. Meteorological data at Syowa Station and Asuka Camp in 1990 [1992, eng] **I-46900**
Jarvis, E.P.
  Effectiveness of different shooting techniques in antarctic firn [1991, eng] **F-46105**
  Short-offset seismic refraction results near Rothera Station, Antarctic Peninsula [1992, eng] **F-47332**
Jaworowski, Z.
  Do glaciers tell a true atmospheric CO2 story [1992, eng] **F-46939**

Aves-Sphenisciformes

BREEDING CYCLES AND REPRODUCTION *(cont.)*

Annual variations in breeding Gentoo and Macaroni Penguins ⌊1992, eng⌋ **B-46942**
Gentoo Penguin diving pattern and performance in relation to foraging ecology ⌊1992, eng⌋ **B-47123**
Eco-ethological variables in a rookery on Ardley I. ⌊1989, spa⌋ **B-47158**
Pygoscelis papua adaptation to stress on Ardley I. ⌊1989, spa⌋ **B-47159**
Egg-laying and fertility in *Pygoscelis papua* ⌊1989, spa⌋ **B-47160**
Breeding biology of the yellow-eyed penguin on Campbell Island ⌊1992, eng⌋ **B-47291**
Seasonal and annual changes of Adélie penguin colonies ⌊1992, jpn⌋ **B-47344**

ECOLOGY

JARE-31 wintering party activity at Showa in 1990 ⌊1992, jpn⌋ **A-46751**
Effects of humans on Adélie penguins ⌊1991, eng⌋ **B-45191**
Effects of implanted or attached instruments on Adélie penguins ⌊1991, eng⌋ **B-45601**
Increases in penguin population related to sea ice cover changes ⌊1992, eng⌋ **B-46820**
Gentoo Penguin diving pattern and performance in relation to foraging ecology ⌊1992, eng⌋ **B-47123**
Eco-ethological variables in a rookery on Ardley I. ⌊1989, spa⌋ **B-47158**
Pygoscelis papua adaptation to stress on Ardley I. ⌊1989, spa⌋ **B-47159**

EMBRYOLOGY

Brood reduction in royal and rockhopper penguins on Macquarie Island ⌊1991, eng⌋ **B-45586**
Egg-laying and fertility in *Pygoscelis papua* ⌊1989, spa⌋ **B-47160**

GEOGRAPHIC DISTRIBUTION

Adélie penguins on Windmill Is. ⌊1991, eng⌋ **B-46468**
Distributions and predator-prey interactions near Bird Island ⌊1992, eng⌋ **B-47290**

LOCOMOTION

Effects of oil pollution of antarctic penguins ⌊1991, eng⌋ **B-45817**

MIGRATION

Annual variations in breeding Gentoo and Macaroni Penguins ⌊1992, eng⌋ **B-46942**

MORPHOLOGY

Beak deformities in emperor penguin chicks ⌊1991, eng⌋ **B-45091**
Sexing of Adélie penguins ⌊1991, eng⌋ **B-45441**
Morphometric variability in the Kerguelen cormorant and the gentoo penguin ⌊1992, eng⌋ **B-47263**
Vocalizations in Emperor and King Penguins ⌊1992, eng⌋ **B-47267**

NUTRITION

Food consumption by predators in a CCAMLR Integrated Study Region ⌊1991, eng⌋ **B-45439**
Interannual variability and prey size selectivity in penguin diet ⌊1991, eng⌋ **B-45442**
Scientific investigations of the National Marine Mammal Laboratory, 1990 ⌊1992, eng⌋ **B-45555**
Feeding ecology of penguins at Heard Island with special emphasis on king penguins ⌊1991, eng⌋ **B-45589**
Diving behaviour of Adélie penguins in Prydz Bay ⌊1991, eng⌋ **B-45592**
Plasma nutrients and metabolites in moulting Macaroni and Gentoo penguins ⌊1992, eng⌋ **B-45937**
King Penguin diet at Possession Island ⌊1992, eng⌋ **B-46310**
Land-based predator impact on zooplankton and micronekton ⌊1992, eng⌋ **B-46411**
Winter diet of Gentoo Penguins at South Georgia ⌊1991, eng⌋ **B-46470**
Winter diving in Gentoo penguins ⌊1992, eng⌋ **B-46671**
Gentoo Penguin diving pattern and performance in relation to foraging ecology ⌊1992, eng⌋ **B-47123**
Foraging behavior of emperor penguins ⌊1992, eng⌋ **B-47336**

PATHOLOGY

Beak deformities in emperor penguin chicks ⌊1991, eng⌋ **B-45091**
Chlorobiphenyls and organochlorine pesticides in various sub-antarctic organisms ⌊1991, eng⌋ **B-45340**
Paramyxoviruses isolated from antarctic and subantarctic penguins, 1976-1979 ⌊1989, eng⌋ **B-45742**
Effects of oil pollution of antarctic penguins ⌊1991, eng⌋ **B-45817**

PHYSIOLOGY

Effect of food temperature on Adélie penguins' metabolic rate ⌊1991, eng⌋ **B-45161**
Effects of humans on Adélie penguins ⌊1991, eng⌋ **B-45191**
Developmental biology of antarctic birds ⌊1991, eng⌋ **B-45318**
Daily pattern of melatonin secretion in the Emperor Penguin ⌊1991, eng⌋ **B-45367**
Effects of implanted or attached instruments on Adélie penguins ⌊1991, eng⌋ **B-45601**
Penguin land rookeries on King George I. ⌊1991, eng⌋ **B-45731**
Paramyxoviruses isolated from antarctic and subantarctic penguins, 1976-1979 ⌊1989, eng⌋ **B-45742**
Effects of oil pollution of antarctic penguins ⌊1991, eng⌋ **B-45817**
Plasma nutrients and metabolites in moulting Macaroni and Gentoo penguins ⌊1992, eng⌋ **B-45937**
Energy relations in penguin eggs ⌊1992, eng⌋ **B-46299**
Diving and energetics in King Penguins ⌊1992, eng⌋ **B-46417**
Diving heart rates in Adélie penguins ⌊1992, eng⌋ **B-46760**
Melatonin rhythms in Adélie penguins ⌊1991, eng⌋ **B-47051**
Melatonin in Adélie penguins in continuous light ⌊1991, eng⌋ **B-47052**
Physiology of emperor penguins diving under sea ice ⌊1992, eng⌋ **B-47112**
Pygoscelis papua adaptation to stress on Ardley I. ⌊1989, spa⌋ **B-47159**
Egg-laying and fertility in *Pygoscelis papua* ⌊1989, spa⌋ **B-47160**
Metabolic and hormonal adaptations of Emperor and King penguins during molt while fasting ⌊1992, eng⌋ **B-47265**

POPULATION

Polar news/Notizie polari, Vol.6, No.9 ⌊1991, ita⌋ **A-45382**
Feeding ecology of penguins at Heard Island with special emphasis on king penguins ⌊1991, eng⌋ **B-45589**
Population estimates of emperor penguins, Mawson Coast, Antarctica ⌊1991, eng⌋ **B-45590**
Birds and mammals at SSSI No.8, Admiralty Bay ⌊1991, eng⌋ **B-45732**
King Penguin breeding biology and population dynamics ⌊1992, eng⌋ **B-46309**
Adélie penguins on Windmill Is. ⌊1991, eng⌋ **B-46468**
Increases in penguin population related to sea ice cover changes ⌊1992, eng⌋ **B-46820**
Growth of Adélie penguin rookery at Cape Royds, 1955-1990 ⌊1991, eng⌋ **B-46846**

Banding

See: Marking

Bathymetry

Expeditions of the RV *Polarstern* in 1990/91, ANTARKTIS IX/1-4 ⌊1992, ger⌋ **D-46763**
Correction of the Weddell Sea western margin topography based on aerogravimetric data ⌊1990, spa⌋ **E-45114**
Bathymetry around Elephant and Clarence Islands ⌊1990, eng⌋ **E-45910**
Cretaceous-Tertiary sea floor off Dronning Maud Land, Antarctica ⌊1992, eng⌋ **E-46765**
Sea bottom topography beneath Ronne Ice Shelf ⌊1986, eng⌋ **F-45503**
Areas of seabed within selected depth ranges in CCAMLR Subarea 48.3, South Georgia ⌊1991, eng⌋ **J-45436**
Winter oceanography in McMurdo Sound ⌊1990, eng⌋ **J-46000**
Global mean sea surface based upon GEOS 3 and Seasat altimeter data ⌊1992, eng⌋ **J-46398**
Oceanographic data of the 31st Japanese Antarctic Research Expedition from Nov. 1989 to Mar. 1990 ⌊1992, eng⌋ **J-46464**
Formation of Antarctic Intermediate and Bottom Waters in oceanic GCMs ⌊1992, eng⌋ **J-46809**
Oceanographic activities during the 1986-1988 expeditions ⌊1989, spa⌋ **J-47152**
Hydrographic survey program ⌊1989, spa⌋ **J-47153**

Behavior

Used as subordinate term under various types of animals (plants)

Benthos

Spatial and temporal photosynthetic compartments in Lake Kitezh [1991, eng] **B-45192**
Spatial distribution of shrimps by underwater photography [1991, eng] **B-45220**
Studies on the Zoarcidae (Teleostei:Perciformes) of the Southern Hemisphere. V. Two new species from the Weddell Sea, Antarctica [1991, eng] **B-45252**
Algal pigment diversity in coastal sediments from Kerguelen Is. [1991, eng] **B-45357**
New *Spadella* from the Antarctic [1991, eng] **B-45386**
Amphipod crustaceans in the sublittoral of Antarctica [1991, eng] **B-45401**
Demersal fish communities of South Georgia [1991, eng] **B-45934**
Macrobenthic community of Maxwell Bay [1991, kor] **B-46081**
Antarctic benthic fauna: amphipods and harpacticoid copepods [1990, ita] **B-46120**
Karyology of some antarctic marine invertebrates [1990, ita] **B-46123**
Chemical bioactivity in marine invertebrates [1990, eng] **B-46273**
Morphology of notothenioids and cottoids [1990, eng] **B-46278**
Shelf and slope molluscan fauna distribution in the Weddell Sea [1992, eng] **B-46386**
Antarctic Isopoda Valvifera [1991, eng] **B-46405**
Marine benthos in Discovery Bay [1990, spa] **B-46695**
Scuba-diving survey of sublittoral macrobenthos at Marion I. [1992, eng] **B-46822**
Trophic resource for benthic foraminifera [1992, eng] **B-46922**
Underwater observation of antarctic fishes for aquarium exhibition [1992, eng] **B-46937**
Antarctic Mollusca, with special reference to the fauna of the Ross Sea [1990, eng] **B-46948**
Nutrient concentration changes in Lake Ô-ike [1992, eng] **B-47036**
Archaeogastropods from Breid Bay [1992, eng] **B-47040**
Ecology of benthic foraminifera [1990, eng] **B-47116**
Benthic Crustacea of Marion and Prince Edward Is. [1991, eng] **B-47165**
Benthic Mollusca of Marion and Prince Edward Is. [1991, eng] **B-47166**
RV *Polarstern* expedition program no.24, Antarktis X/3-5 [1992, eng] **D-46057**
Holocene meltwater variations recorded in antarctic coastal marine benthic assemblages [1991, eng] **E-46034**
Limnological studies in Antarctica [1990, ita] **E-46135**
Paleoenvironments of the Nordenskjöld Formation [1991, eng] **E-46723**
Upper Oligocene-Holocene benthic foraminifera of the Ross Sea region [1988, eng] **E-47237**
Sources and transport of suspended calcites in Pacific Deep Water [1991, eng] **J-45158**
Influence of oceanographic processes on biomass coupling [1991, eng] **J-45948**

Bibliographies

Antarctica and global climatic change: a guide to recent literature [1991, eng] **A-45574**
Publications and theses on antarctic and subantarctic birds, 1990 [1991, eng] **B-46473**
Annotated bibliography of antarctic invertebrates [1992, eng] **B-46963**
Bibliographic database for project collections of the Antarctic Marine Geology Research Facility and Core Library [1990, eng] **E-46518**
Antarctica and global climatic change [1991, eng] **I-45560**
Used as subordinate term under broad subject categories (see p. V)

Biochemistry

Pathogenic effects of *Tolypocladium cylindrosporum* Gams in *Culex pipiens* L. [1991, spa] **B-45081**
Effect of food temperature on Adélie penguins' metabolic rate [1991, eng] **B-45161**
Age pigments in a laboratory population of krill [1991, eng] **B-45164**
Photosynthesis in cryptoendolithic microbial communities [1991, eng] **B-45170**
Physiology and population of the ascidian *Cnemidocarpa verrucosa* Lesson [1991, eng] **B-45178**
Spatial and temporal photosynthetic compartments in Lake Kitezh [1991, eng] **B-45192**
PCBs and organochlorine pesticides in Indian Ocean plankton [1991, eng] **B-45221**
Limnological properties of antarctic ponds during winter freezing [1991, eng] **B-45222**
Effect of salinity on algae physiology [1991, eng] **B-45254**
Developmental biology of antarctic birds [1991, eng] **B-45318**
Plasmids in antarctic soil bacteria [1991, eng] **B-45339**
Chlorobiphenyls and organochlorine pesticides in various sub-antarctic organisms [1991, eng] **B-45340**
Digestive enzymes in a South Georgia I. beetle [1991, eng] **B-45343**
Surface layer sea ice assemblages, Weddell and Scotia Seas [1991, eng] **B-45344**
Isolation of five strains of thermophilic eubacteria in Antarctica [1991, eng] **B-45355**
Algal pigment diversity in coastal sediments from Kerguelen Is. [1991, eng] **B-45357**
Crossed immunoelectrophoretic analysis of proteins from krill [1991, eng] **B-45360**
Isolation and immunology of 3 serine proteinases from krill [1991, eng] **B-45361**
Novel hyaluronic acid-degrading enzyme from krill [1991, eng] **B-45362**
Antibodies against phocine herpesvirus in sera of seals [1991, eng] **B-45363**
Biochemistry and osmotic adjustments in green algae [1991, eng] **B-45388**
Lipids of cultured *Phaeocystis pouchetii* [1991, eng] **B-45389**
Responses of green alga *Prasiola crispa* ssp. *antarctica* to salinity stress [1991, eng] **B-45402**
Hematology of fish *Bathydraco marri* Norman [1991, eng] **B-45405**
Giant kelp and growth of bacteria [1991, eng] **B-45406**
New glycerides from an antarctic nudibranch [1991, eng] **B-45485**
Ecology and molecular biology of antarctic microorganisms (EMBAM) [1991, eng] **B-45579**
Krill lipid profiles for determination of its diet, abundance and distribution [1991, eng] **B-45584**
Life under extreme conditions: biochemical adaptation [1991, eng] **B-45624**
Role of antifreeze proteins in the freezing avoidance of cold water fish [1991, eng] **B-45625**
Structure and functions of hemoglobins in an antarctic teleost [1991, eng] **B-45626**
Cold-stable microtubules from antarctic fish [1991, eng] **B-45627**
Feeding stimulation in sea bream fed on krill diets [1990, eng] **B-45711**
Variations of marine bacterioplankton on antarctic coasts [1991, eng] **B-45723**
Renin-angiotensin system in antarctic fishes [1991, eng] **B-45728**
Penguin land rookeries on King George I. [1991, eng] **B-45731**
Influence of sex and maturity stage on krill lipids [1991, eng] **B-45734**
Lipid composition of some antarctic Crustacea [1991, eng] **B-45735**
Oxidability of krill lipids [1991, eng] **B-45736**
Heavy metals in the thalli of *Usnea antarctica* near Arctowski Station [1991, eng] **B-45739**
Paramyxoviruses isolated from antarctic and subantarctic penguins, 1976-1979 [1989, eng] **B-45742**
Amino acids and oxygen-binding properties of an antarctic teleost [1992, eng] **B-45841**
Nutrient stress in ice microalgae of McMurdo Sound in spring [1992, eng] **B-45849**
Soil nitrogen on Marion I. [1992, eng] **B-45852**
Blood physiology and ecological consequences in Weddell Sea fishes [1991, eng] **B-45864**
Solar radiation protector isolated from antarctic algae *Desmarestia menziesii* [1990, spa] **B-45936**
Plasma nutrients and metabolites in moulting Macaroni and Gentoo penguins [1992, eng] **B-45937**
Ecology of bottom ice algae: 3. Comparative physiology [1991, eng] **B-45942**
Bacteria and protozoan grazing in 1989 spring bloom [1990, eng] **B-46020**

Biochemistry *(cont.)*

Phytoplankton growth and zooplankton grazing in Gerlache Strait [1990, eng] **B-46025**
Ozone and trophic interactions in the southern ocean [1991, eng] **B-46032**
Microbial mineralization in soils and plant material from Antarctica [1991, eng] **B-46033**
Digestive enzymes from antarctic krill [1991, eng] **B-46055**
Method for obtaining krill hydrolytic enzymes [1991, eng] **B-46056**
New psychrotrophic bacterium from Schirmacher Hills [1992, eng] **B-46058**
Enzyme from an antarctic psychrotroph [1992, eng] **B-46076**
Nitrogen and carbon isotopes in Weddell Sea invertebrates [1991, eng] **B-46099**
Proceedings of the 1st Meeting on Biology in Antarctica, Rome, Italy, CNR, June 22-23, 1989 [1990, ita] **B-46112**
Cytogenetics of notothenioid fishes [1990, ita] **B-46125**
Morphology and biology of ciliates from the Ross Sea [1990, ita] **B-46126**
Low temperature adaptation in antarctic teleosts [1990, ita] **B-46127**
Heavy metal contamination and adaptation to dissolved oxygen increases in fish [1990, ita] **B-46128**
Enzymatic adaptation to low temperatures in antarctic teleosts [1990, ita] **B-46130**
Levels of chlorinated hydrocarbons and mixed function oxidase activity in antarctic organisms [1990, ita] **B-46131**
Metal contents in tissues of *Adamussium colbecki* and role of metallothioneins in detoxification of heavy metals [1990, ita] **B-46132**
Adamussium colbecki and heavy metals in the Ross Sea [1990, ita] **B-46133**
Regulation of the gene hsp70 in antarctic fish [1990, ita] **B-46134**
Mercury and selenium in mollusca and fish from the Ross Sea [1991, eng] **B-46150**
Persistent pesticides in fresh waters [1991, eng] **B-46168**
Fine structure of a terrestrial cyanobacterial mat [1992, eng] **B-46185**
Variations in C and N isotopes in Weddell Sea particulates [1991, eng] **B-46232**
CO2 fixation in the southern ocean [1991, eng] **B-46233**
Production of biogenic silica in the Weddell and Scotia Seas [1991, eng] **B-46240**
Biogenic silica cycling in the upper waters of the Ross Sea [1991, eng] **B-46241**
Annual production of biogenic silica in the antarctic ocean [1991, eng] **B-46242**
Anaerobic coiled bacterium from Ace Lake [1991, eng] **B-46251**
Ultraviolet-absorbing compounds in antarctic organisms [1990, eng] **B-46257**
Phytoplankton physiology and UV radiation [1990, eng] **B-46258**
Ultraviolet radiation effects on photosynthetic rates of phytoplankton [1990, eng] **B-46259**
Bahia Paraiso fuel spill effect on marine algae [1990, eng] **B-46260**
Oxygen and microalgal communities near Palmer Station [1990, eng] **B-46262**
Tintinnid cytoplasmic volume and biomass [1990, eng] **B-46263**
Nutrients in sea ice and underlying layer of McMurdo Sound [1990, eng] **B-46264**
Chemical bioactivity in marine invertebrates [1990, eng] **B-46273**
Lipids in ctenophores and medusae [1990, eng] **B-46277**
Microtubule stabilizing in fish [1990, eng] **B-46280**
Fe and Mn effects on plankton [1991, eng] **B-46290**
Effect of Fe on phytoplankton [1991, eng] **B-46291**
Phytoplankton division rates [1991, eng] **B-46292**
Phytoplankton division rates [1991, eng] **B-46292**
Glacial ocean productivity [1991, eng] **B-46293**

Breeding cycles and reproduction
Used as subordinate term under various types of animals (plants)

Bryophyta
Soil mycology [1990, ita] **B-46114**

ECOLOGY
Bryophyte physiology after leaching and freeze-thaw cycles [1992, eng] **B-47321**

MUSCI
Biological surveys in the Sör Rondane Mountains, 1989 and 1990 [1991, eng] **B-45183**
Spatial and temporal photosynthetic compartments in Lake Kitezh [1991, eng] **B-45192**
Stratigraphic and paleoclimatic studies of a 5500-year-old moss bank on Elephant Island, Antarctica [1991, eng] **E-45393**

PHYSIOLOGY
Nitrogen fixation in the subantarctic Macquarie Island [1992, eng] **B-46827**
Bryophyte physiology after leaching and freeze-thaw cycles [1992, eng] **B-47321**

Bryophyta-Musci
Vegetation cover of Canto Point, Greenwich I. [1990, spa] **B-46696**

BREEDING CYCLES AND REPRODUCTION
Culture of a moss from a lake near Showa Station [1992, eng] **B-47034**

ECOLOGY
Moss sporophytes in extreme southern locations [1992, eng] **B-45851**
Structure of moss colonies composed of two species on King George I. [1992, eng] **B-47345**

GEOGRAPHIC DISTRIBUTION
Chorisodontium (Dicranaceae, Musci) in southern South America [1991, eng] **B-45844**
Moss sporophytes in extreme southern locations [1992, eng] **B-45851**

MORPHOLOGY
Taxonomic transfer of a Macquarie Island moss species [1992, eng] **B-46424**
Culture of a moss from a lake near Showa Station [1992, eng] **B-47034**

PHYSIOLOGY
Nitrogen retention in plants and soils [1992, eng] **B-46368**
Net production of moss community in Langhovde Hills [1992, eng] **B-46749**
Joint Japanese-Chinese terrestrial biology program in 1990-1991 [1992, jpn] **B-46753**
Polyol and sugar content of terrestrial plants from continental Antarctica [1992, eng] **B-47323**
Structure of moss colonies composed of two species on King George I. [1992, eng] **B-47345**
Radionuclide content in samples from the Terra Nova Bay Station [1991, eng] **E-46157**
Ozone level trends from moss specimens [1990, eng] **I-45603**
Radioactive precipitation levels on King George I. [1989, por] **I-46622**

POPULATION
Net production of moss community in Langhovde Hills [1992, eng] **B-46749**

TAXONOMY
Taxonomic transfer of a Macquarie Island moss species [1992, eng] **B-46424**
Aquatic mosses from lakes near Showa Station [1992, eng] **B-47042**

Bryozoa
Cretaceous hermit crab and bryozoan symbiosis [1992, eng] **E-46369**

GEOGRAPHIC DISTRIBUTION
New and little-known Bryozoa from Antarctica [1991, eng] **B-46838**

MORPHOLOGY
Some antarctic and subantarctic bryozoan species [1992, eng] **B-46305**
New and little-known Bryozoa from Antarctica [1991, eng] **B-46838**

TAXONOMY
Some antarctic and subantarctic bryozoan species [1992, eng] **B-46305**

Building

- Determination of methane concentration in air extracted from antarctic ice core samples [1991, eng] **F-46688**
- Do glaciers tell a true atmospheric CO2 story [1992, eng] **F-46939**

Climate

CYCLES AND TRENDS *(cont.)*

Computational modeling of antarctic lake ice [1992, eng] **F-47357**
Models of oceanic climates under mixed boundary conditions [1991, eng] **I-45073**
Annual cycle in antarctic and middle south latitudes [1990, eng] **I-45126**
Air temperature variations in Argentina and at stations in the adjacent subantarctic area, 1903-1989 [1990, spa] **I-45127**
Antarctic climate manifestations from observations on South Orkney Is. [1990, spa] **I-45131**
Joining Australia to Antarctica: GCM implications for the Cenozoic record of antarctic glaciation [1991, eng] **I-45251**
New, detailed ice-age oxygen-18 record from the ice-sheet margin in central West Greenland [1991, eng] **I-45268**
Polar climatology in the modern epoch [1991, rus] **I-45308**
Younger Dryas in southern South America? [1991, eng] **I-45338**
Investigations of required sampling regimes for environmental parameters [1991, eng] **I-45443**
Climate-ice interactions [1991, eng] **I-45472**
Polar regions, influence on climate variability and change [1991, eng] **I-45476**
Global ozone trends from a reanalysis of TOMS data [1991, eng] **I-45482**
Computer simulations of ancient climates [1991, eng] **I-45513**
Antarctica and global climatic change [1991, eng] **I-45560**
Prominent issues relating Antarctica and global climate change [1991, eng] **I-45562**
Global climate models and antarctic climatic change [1991, eng] **I-45563**
Antarctica and global climatic change: a geological perspective [1991, eng] **I-45564**
Antarctic ice studies in global climatic change: a comment [1991, eng] **I-45565**
Atmosphere-ice-ocean: do we really understand what is going on [1991, eng] **I-45567**
Strategies for mitigating impacts of climatic change [1991, eng] **I-45572**
Science and challenge of mitigating impacts of climatic change [1991, eng] **I-45573**
Role of the Southern Hemisphere in current global climatic changes [1990, rus] **I-45635**
Long-term variations of the integral atmospheric moisture content [1990, rus] **I-45639**
Multiyear cloudiness variability in Antarctica [1990, rus] **I-45642**
Climatic system susceptibility to its radiation parameters [1990, rus] **I-45654**
Temperature and wind variations in the spring buildup of the free atmosphere [1990, rus] **I-45661**
Long-period fluctuations of surface air temperature inversion characteristics in Antarctica [1990, rus] **I-45662**
Sensitivity of the Southern Hemisphere circulation to leads in the antarctic pack ice [1991, eng] **I-45808**
Vostok ice core study of ice volume changes during penultimate deglaciation [1991, eng] **I-45932**
Cloud radiative effects at the South Pole during winter [1991, eng] **I-45986**
Antarctic sea ice and temperature variations [1991, eng] **I-45992**
Simulation of upper ocean general circulation [1992, eng] **I-46066**
Potential impacts of climate change on the southern ocean system [1991, eng] **I-46093**
Evidence for an early Holocene climatic optimum in the antarctic deep ice-core record [1992, eng] **I-46136**
Abrupt climatic change related to unstable ice-sheet dynamics: toward a new paradigm [1992, eng] **I-46207**
Global warming problem [1990, eng] **I-46326**
Atmospheric methane and global climate [1990, eng] **I-46327**
Nitrous oxide and halocarbon measurements [1990, eng] **I-46328**
Winds in the coastal area of Adélie Land [1990, eng] **I-46332**
Comments on the origin of dust in East Antarctica for present and ice age conditions [1992, eng] **I-46430**
Sources of continental dust over Antarctica during the last glacial cycle [1992, eng] **I-46433**
Climatic changes and aerosol transport in the Antarctic and Arctic [1991, eng] **I-46436**
Intergovernmental Panel on Climate Change revised emissions scenarios [1992, eng] **I-46455**
Global propagation of interannual fluctuations in atmospheric angular momentum [1992, eng] **I-46458**
Small ice cap instability in seasonal energy balance models [1992, eng] **I-46582**
Global ozone depletion and the antarctic ozone hole [1992, eng] **I-46685**
Numerical experiment of climatic effect of antarctic sea ice during the Northern Hemisphere summer [1992, eng] **I-46711**
Comparison of Lanzhou loess profile with Vostok ice core in Antarctica over the last glaciation cycle [1992, eng] **I-46746**
Atmospheric CO2: global change and regulation mechanisms [1992, eng] **I-46771**
Global warming and sea level rise—discussions and report from IPCC workshop [1991, jpn] **I-47018**
Deglaciation, impact on ocean circulation [1991, eng] **J-45473**
Oceanography on a global scale: the new challenge [1991, eng] **J-46725**

MICROCLIMATE

Joint Japanese-Chinese terrestrial biology program in 1990-1991 [1992, jpn] **B-46753**
Utilization of coastal climate energy resources [1990, rus] **I-45640**

MICROCLIMATES

Photosynthetic production of *Usnea sphacelata* [1991, eng] **B-45195**
Net production of moss community in Langhovde Hills [1992, eng] **B-46749**
Temperature variation effects on maritime island habitats [1992, eng] **B-47318**
Spatial and temporal characteristics of the Little Ice Age: the antarctic ice core record [1991, eng] **F-46041**
Climate of West Antarctica [1990, rus] **I-45644**
Meteorological data from the Langhovde Hills, summers of 1978-1989 [1992, eng] **I-46467**
Interaction between antarctic ice extension and Brazilian climate [1989, por] **I-46625**
Lidar tropospheric cloud characterization [1989, eng] **I-46786**
Surface layer ozone and meteorological variables at Terra Nova Bay Station [1989, eng] **I-46787**

MODELS

Equilibrium ice sheet scaling in climate modeling [1992, eng] **F-46427**
Simulation of oxygen isotope variations in atmospheric flow [1992, eng] **I-47225**

Clouds

Snowfall and snow clouds at Showa Station [1992, eng] **F-46555**
MOS-1 data received at Showa Station [1990, jpn] **F-47316**
Is the depletion of the ozone layer due to chemistry [1991, ice] **I-45155**
Reduced antarctic ozone depletions in a model with hydrocarbon injections [1991, eng] **I-45172**
Nitric acid transport from the polar stratosphere to the troposphere [1991, eng] **I-45230**
Heterogeneous chemistry on polar stratospheric clouds [1991, eng] **I-45342**
Polar stratospheric clouds [1991, eng] **I-45477**
Backscattering from aerosols in polar atmospheric clouds [1991, eng] **I-45611**
Remote sensing of clouds and surface radiation budget over polar regions [1992, eng] **I-45614**
High-latitude moisture structure determined from HIRS water vapour imagery [1992, eng] **I-45617**
Pattern recognition analysis of polar clouds during summer and winter [1992, eng] **I-45618**
Cloud distribution in the Antarctic from AVHRR data and radiation measurements at the surface [1992, eng] **I-45619**
Use of TOVS observations for the study of polar and arctic lows [1992, eng] **I-45620**
Radiation climate in the Antarctic [1990, rus] **I-45633**
Radiant heat transfer in the antarctic atmosphere [1990, rus] **I-45641**
Multiyear cloudiness variability in Antarctica [1990, rus] **I-45642**
Direct reaction of HOCl with HCl on PSC speeds ozone depletion [1992, eng] **I-45687**
Polar stratospheric clouds and the ozone hole [1991, eng] **I-45811**

Spring polar ozone behavior [1992, eng] **I-45843**
Cloud radiative effects at the South Pole during winter [1991, eng] **I-45986**
Summer cloud evolution at Terra Nova Bay [1988, eng] **I-46091**
Remote sensing over oceans of optically thin cirrus and its significance [1990, eng] **I-46103**
Ozone and cloud properties from ultraviolet-monitor measurements at Palmer Station [1990, eng] **I-46322**
Ozone and aerosol vertical profiles at McMurdo, spring 1989 [1990, eng] **I-46323**
Study of polar stratospheric clouds at the South Pole [1990, eng] **I-46325**
Solar radiation at Zhongshan Station [1991, chi] **I-46454**
Possible methane-induced polar warming in the early Eocene [1992, eng] **I-46456**
Radiophysical investigations of the characteristics of cloudy atmosphere in Antarctica [1991, rus] **I-46494**
Cloud-radiative forcing over the snow-covered surface around Asuka Station, Antarctica [1992, eng] **I-46554**
PPI radar data at Showa Station, Feb.-Dec. 1989 [1992, eng] **I-46593**
Antarctica from NOAA satellites. Clouds, ice and snow [1992, eng] **I-46595**
Dynamics and global winter ozone distribution [1992, eng] **I-46633**
Climate forcing due to non-sea-salt sulfates [1991, eng] **I-46662**
Radiative effects of polar stratospheric clouds [1992, eng] **I-46681**
Global ozone depletion and the antarctic ozone hole [1992, eng] **I-46685**
Lidar tropospheric cloud characterization [1989, eng] **I-46786**
Stratospheric clouds at South Pole, winter 1988 [1989, eng] **I-46790**
Application of lidar for the antarctic stratospheric research [1989, eng] **I-46791**
Stratospheric clouds and ozone depletion [1989, eng] **I-46792**
Balloon-borne CCD sonde for observations of stratospheric ice crystals [1989, eng] **I-46793**
Cloud acidity, lower troposphere and stratospheric ozone depletion [1991, eng] **I-46868**
Adsorption of HCl on ice under stratospheric conditions [1992, eng] **I-46875**
Optical effects of polar stratospheric clouds on the retrieval of TOMS total ozone [1992, eng] **I-46901**
Ozone depletion in Antarctica in 1991 [1992, eng] **I-47054**
Lidar observations of stratospheric clouds at South Pole [1992, eng] **I-47145**
Stratospheric clouds at South Pole during 1988 [1992, eng] **I-47146**

Coelenterata
Nitrogen and carbon isotopes in Weddell Sea invertebrates [1991, eng] **B-46099**
PHYSIOLOGY
Lipids in ctenophores and medusae [1990, eng] **B-46277**

Cold effects
See: Low temperature effects

Communication
See: HF communication; Radio communication

Compaction
Used as subordinate term under various types of ice (snow)

Conference
Glaciology in International and National Scientific Programs
Workshop and seminar of the section on glaciology, Fall 1989 [1990, rus] **A-45110**

Conferences
First Latin American Conference on Antarctic Geophysics, Geodesy and Space Research, Buenos Aires, July 30-Aug. 3, 1990. Proceedings [1990, spa] **A-45112**
Polar news/Notizie polari, Vol.6, No.6 [1991, ita] **A-45381**
SCAR bulletin No.104, Jan. 1992 [1992, eng] **A-45559**
SCAR bulletin No.105, April 1992 [1992, eng] **A-46075**
Joint Committee on Antarctic Research [1990, rus] **A-46111**
SCAR report No.7, Jan. 1992 [1992, eng] **A-46182**
SCAR report No.8, Jan. 1992 [1992, eng] **A-46183**

Fiction
Austral voyage. A set of inquiries on the voyage [1984, fre] A-46395
Firn
Microwave signature measurements of antarctic firn [1991, eng] F-46504
Short-offset seismic refraction results near Rothera Station, Antarctic Peninsula [1992, eng] F-47332
CHEMISTRY
Deciphering recent structures and Holocene evolution of the marginal East Antarctic ice cover [1991, eng] F-46649
CORES
Stratigraphy of a 16 m firn core near Druzhnaya I [1990, eng] F-45519
Snow-accumulation variability from firn-core stratigraphy [1991, eng] F-45544
CRYSTALS
Firn stratigraphy, density and crystal structure on Law Dome [1991, eng] F-46848
DENSITY
Glaciological data [1990, eng] F-45526
Thermal properties of snow/firn on the Law Dome ice cap [1991, eng] F-46851
SEISMIC EXPLORATION
Effectiveness of different shooting techniques in antarctic firn [1991, eng] F-46105
STRATIGRAPHY
Snow-stratification investigation on an antarctic ice stream with an X-band radar system [1991, eng] F-45542
Snow-accumulation variability from firn-core stratigraphy [1991, eng] F-45544
Firn stratigraphy, density and crystal structure on Law Dome [1991, eng] F-46848
TEMPERATURE
Stratigraphy of a 16 m firn core near Druzhnaya I [1990, eng] F-45519
Thermal properties of snow/firn on the Law Dome ice cap [1991, eng] F-46851

First aid
Accident and risk evaluation on Finnish antarctic expeditions [1992, eng] **H-46072**
See [also]: Search and rescue; Survival
Fisheries
Japanese activities for BIOMASS [1991, eng] **A-46745**
Historical review of antarctic ichthyology [1990, eng] **A-47056**
Krill fishing activity in the southwest Atlantic [1991, eng] **B-45218**
Sampling krill trawl catches [1991, eng] **B-45412**
Distribution of krill aggregations around Coronation I. in 1989/90 [1991, eng] **B-45413**
Differences in target strength of krill swarms at 38 and 120 kHz [1991, eng] **B-45414**
Midwater trawl catchability in relation to krill [1991, eng] **B-45415**
Krill biomass assessment in Area 48, fall 1989-1990 [1991, eng] **B-45416**
Distribution and biomass of krill fishery around South Georgia [1991, eng] **B-45417**
Krill resources and distribution off Wilkes Land, 1986-1989 [1991, eng] **B-45418**
Krill resources in CCAMLR Divisons 58.4.2 and 58.4.3, 1988-1990 [1991, eng] **B-45419**
Factors to consider in developing management measures for krill [1991, eng] **B-45420**
Operational management of krill fisheries in Subareas 48.1, 48.2 and 48.3 [1991, eng] **B-45421**
Demersal fish surveys at South Georgia, Jan.-Feb. 1990 [1991, eng] **B-45422**
Fishery for *Patagonotothen brevicauda guntheri* in CCAMLR Subarea 48.3 [1991, eng] **B-45425**
Trawl bag selectivity in the *Champsocephalus gunnari* fishery [1991, eng] **B-45427**
Fishing standardization for *Champsocephalus gunnari* at South Georgia [1991, eng] **B-45429**
Acoustic surveys of myctophid biomass in the South Atlantic [1991, eng] **B-45434**
Managing depleted fish stocks [1991, eng] **B-45437**
Management of the antarctic krill fishery [1992, eng] **B-45557**
Fisheries investigations in the Heard Island AFZ [1991, eng] **B-45593**
Discards from squid trawlers as food for Falkland Is. albatrosses [1992, eng] **B-45720**
Parasite fauna as potential stock indicators of antarctic whales [1991, eng] **B-45757**
Satellite tracking of wandering albatrosses [1992, eng] **B-45850**
Demersal fish communities of South Georgia [1991, eng] **B-45934**
Antarctic ecology and exploitation [1987, spa] **B-45938**
Distribution and abundance of the antarctic krill *(Euphausia superba):* a brief overview [1991, kor] **B-46079**
Ecology of an exploited antarctic fish community [1990, eng] **B-46911**
Post-recruit growth of the Patagonian squid *Loligo gahi* (d'Orbigny) [1991, eng] **B-46960**
Anotopterus pharao, a fish associated with krill [1992, eng] **B-47033**
Research, exploitation, and conservation of antarctic fishes [1990, eng] **B-47060**
Managing the krill fishery [1991, eng] **B-47312**
Bycatch of fish in the South Atlantic krill fishery [1992, eng] **B-47319**
State of exploited antarctic fish stocks [1991, eng] **J-45156**
Accumulation of anthropogenic marine trash on Heard and Macquarie Is. [1991, eng] **J-45816**

Geomagnetic disturbances

Effect of magnetic activity on the neutral atmosphere [1990, rus] **I-45664**

Linear transformations in the polar upper atmosphere ⌊1991, spa⌋ **K-45082**
Collective response from various antarctic stations ⌊1991, spa⌋ **K-45083**
Anisotropy in the polar wind plasma parameters for subsonic conditions ⌊1990, spa⌋ **K-45140**
High latitude trough and travelling ionospheric disturbances ⌊1991, eng⌋ **K-45162**
Results and plans of polar geophysical studies ⌊1991, rus⌋ **K-45309**
Influence of geomagnetic activity on vertical winds in the D region ⌊1991, eng⌋ **K-45391**
Geomagnetic activity influence on horizontal winds in the D region ⌊1991, eng⌋ **K-45392**
Prediction of geomagnetic activity at high austral latitudes ⌊1990, eng⌋ **K-46187**
Near-real time data from Showa for space weather forecast ⌊1992, eng⌋ **K-47178**
Characteristics of 30-MHz interference noises observed by riometers ⌊1992, jpn⌋ **K-47339**

ACTIVITY INDICES
Dependence of polar hole density on magnetic and solar conditions ⌊1991, eng⌋ **K-46425**
Derivation of polar cap AE indices ⌊1992, eng⌋ **K-47179**

BAYS AND PULSATIONS
CNA pulsations associated with geomagnetic sudden commencements ⌊1991, eng⌋ **K-45371**
Conjugacy of CNA pulsations and their source movement in the auroral zones ⌊1991, eng⌋ **K-45372**
Pc 1 bursts in the dayside boundary layer region ⌊1992, eng⌋ **K-46179**
Upper atmosphere physics data, Syowa and Asuka Stations, 1989 ⌊1992, eng⌋ **K-46181**
Magnetic pulsations in the polar cap ⌊1990, eng⌋ **K-46515**
Geomagnetic and geoelectric pulsations at Comandante Ferraz Station ⌊1989, por⌋ **K-46616**
Estimation of geomagnetic conjugate points by using Pc5 pulsations ⌊1992, jpn⌋ **K-46747**
Geomagnetic pulsations at the Great Wall Station and Beijing ⌊1992, chi⌋ **K-46895**
Pc1-2 magnetic pulsations: ground cusp/cleft signature ⌊1991, eng⌋ **K-47210**
Unstructured Pc1 emissions near the auroral oval ⌊1991, eng⌋ **K-47211**
Polarization of irregular pulsations of diminishing period ⌊1992, eng⌋ **K-47301**

STORMS
Auroral ruptures observed at Belgrano II Station ⌊1990, spa⌋ **K-45139**
North and South auroral ring behavior during two substorms in Feb. 1984 ⌊1990, spa⌋ **K-45141**
Magnetospheric response to the passages across the heliographic current ⌊1990, eng⌋ **K-45142**
CNA pulsations associated with geomagnetic sudden commencements ⌊1991, eng⌋ **K-45371**
X and gamma ray background observations in Antarctica ⌊1989, eng⌋ **K-46614**
Electron density variations in the South Atlantic, Aug. 1972 ⌊1992, eng⌋ **K-46640**
Case study of plasma structure in the dusk sector associated with enhanced magnetospheric convection ⌊1992, eng⌋ **K-46976**

Geomagnetic field
Geophysical studies of the west antarctic rift system ⌊1991, eng⌋ **E-45403**
NIPR Symposium on Antarctic Geosciences, 11th ⌊1991, eng⌋ **E-46191**
Upper atmosphere data recording at Belgrano II Station ⌊1990, spa⌋ **K-45136**
Three dimensional ray tracing of whistler mode waves ⌊1985, eng⌋ **K-47375**
Seismic profiles of the South Shetlands and Bransfield Strait ⌊1990, spa⌋ **L-46945**
See ⌊also⌋: Magnetic field (in space); Paleomagnetism

ANOMALIES
Magnetic anomalies over the James Ross Island and surrounding areas ⌊1992, spa⌋ **C-47285**
Correction of the Weddell Sea western margin topography based on aerogravimetric data ⌊1990, spa⌋ **E-45114**
Considerations on the morphology of the western Weddell Sea based on aerogeophysical data ⌊1990, spa⌋ **E-45117**
Magnetic properties of volcanites from Mount Melbourne ⌊1988, eng⌋ **E-45707**
Active margin processes along the Antarctic Peninsula ⌊1992, eng⌋ **E-46067**
Continental margins of the Red Sea with a comparison to Wilkes Land ⌊1991, eng⌋ **E-46982**
New aeromagnetic and bedrock elevation data from the area around Haag Nunataks, West Antarctica ⌊1986, eng⌋ **F-45502**
Magnetic anomalies on Deception I. and their integration in the study of Bransfield Strait ⌊1990, spa⌋ **L-45120**
Characteristics of secular variations for epoch 1969.5 in antarctic and subantarctic regions ⌊1990, spa⌋ **L-45143**
Effects of ridge crest-trench interaction on Antarctic-Phoenix spreading ⌊1991, eng⌋ **L-45167**
Ground geomagnetic survey of central Victoria Land, 1986-1988 ⌊1988, eng⌋ **L-45706**
Regional anomalies from aeromagnetic survey in Victoria Land ⌊1991, eng⌋ **L-45800**
1988/89 Italian antarctic geophysical survey ⌊1991, eng⌋ **L-45802**
Expedition ANTARKTIS-VIII of RV *Polarstern* 1989/90: Reports of Legs ANT-VIII/6-7 ⌊1991, ger⌋ **L-45865**
Magnetic anomalies in Bransfield Strait ⌊1991, kor⌋ **L-46084**
Magnetic survey on Ongul I. ⌊1991, eng⌋ **L-46193**
Magnetic anomalies in southern Bransfield Strait ⌊1990, spa⌋ **L-46943**

CONJUGACY
Conjugacy of CNA pulsations and their source movement in the auroral zones ⌊1991, eng⌋ **K-45372**
Estimation of geomagnetic conjugate points by using Pc5 pulsations ⌊1992, jpn⌋ **K-46747**
Geomagnetic pulsations at the Great Wall Station and Beijing ⌊1992, chi⌋ **K-46895**
Polarization of irregular pulsations of diminishing period ⌊1992, eng⌋ **K-47301**
See ⌊also⌋: Conjugate points

MAGNETIC POLES
Pangea in Permian to Jurassic time ⌊1991, eng⌋ **E-46716**
Results and plans of polar geophysical studies ⌊1991, rus⌋ **K-45309**
Geomagnetic reversal paths and field secular variations ⌊1992, eng⌋ **K-46642**
Effects of ridge crest-trench interaction on Antarctic-Phoenix spreading ⌊1991, eng⌋ **L-45167**
Paleomagnetic data from the Mt. Melbourne volcanic area ⌊1991, eng⌋ **L-45801**

SECULAR VARIATIONS
Monthly averages of geomagnetic components X, Y and Z at Dumont d'Urville ⌊1990, spa⌋ **K-45137**
Geomagnetic reversal paths and field secular variations ⌊1992, eng⌋ **K-46642**
Characteristics of secular variations for epoch 1969.5 in antarctic and subantarctic regions ⌊1990, spa⌋ **L-45143**
Geomagnetic observation at Terra Nova Bay Station, 1986-1989 ⌊1991, eng⌋ **L-45805**

STRENGTH
Geomagnetic field paleointensities obtained from rocks ⌊1991, eng⌋ **E-46200**

SURVEYS
Magnetic anomalies over the James Ross Island and surrounding areas ⌊1992, spa⌋ **C-47285**
Accurate gravity air-link between South America and the Antarctic Peninsula ⌊1990, eng⌋ **L-45116**
Magnetic anomalies on Deception I. and their integration in the study of Bransfield Strait ⌊1990, spa⌋ **L-45120**
Comparison between the total geomagnetic field reference values and those measured in the Drake Passage ⌊1990, spa⌋ **L-45123**
Ground geomagnetic survey of central Victoria Land, 1986-1988 ⌊1988, eng⌋ **L-45706**
Acquisition, processing and preliminary results of the Antarctic 1987-88 geophysical survey ⌊1988, eng⌋ **L-45708**
Regional anomalies from aeromagnetic survey in Victoria Land ⌊1991, eng⌋ **L-45800**
1988/89 Italian antarctic geophysical survey ⌊1991, eng⌋ **L-45802**
Geomagnetic observation at Terra Nova Bay Station, 1986-1989 ⌊1991, eng⌋ **L-45805**
Polar patrol balloon magnetic field survey ⌊1991, eng⌋ **L-45880**

Geomagnetic field
  SURVEYS *(cont.)*
    Magnetic anomalies in Bransfield Strait [1991, kor] **L-46084**
    Magnetic survey on Ongul I. [1991, eng] **L-46193**
    Configuration and structure of the subglacial crust [1991, eng] **L-46343**
  TRANSIENT VARIATIONS
    Collective response from various antarctic stations [1991, spa] **K-45083**
    Monthly averages of geomagnetic components X, Y and Z at Dumont d'Urville [1990, spa] **K-45137**
    Pc 1 bursts in the dayside boundary layer region [1992, eng] **K-46179**

Characteristics of antarctic glaciers as a reflection of atmospheric processes [1990, rus] **I-46108**

MORPHOLOGY

Variations of ice cliff margin of Strandline Glacier, 1987-1988 [1988, eng] **E-45704**

RADIOACTIVITY

Stable isotope distribution in the Cazadora Glacier [1989, spa] **F-47231**

SEISMIC EXPLORATION

Analysis of seismic data from ice stream C [1990, eng] **F-45916**

SOUNDINGS

Analysis of radar data [1990, eng] **F-45917**

Coherent Antarctic Radar Depth Sounder (CARDS) design, development and results [1989, eng] **F-46999**

STRATIGRAPHY

Internal layering and bedrock topography of ice stream C [1990, eng] **F-45915**

Vertical distribution of some oligo-elements in the Cazadora Glacier near the Juan Carlos I Station [1989, spa] **F-47232**

STRUCTURE

Type of plastic deformation of ice in glacier sheets [1991, eng] **F-46656**

Record of the 1988-1989 expedition at the Spanish Juan Carlos I Station [1989, spa] **F-47227**

Structural analysis of the Cazadora Glacier ice, directional anisotropy quantification and subglacial drainage prediction [1989, spa] **F-47233**

SURFACE FEATURES

Variations of ice cliff margin of Strandline Glacier, 1987-1988 [1988, eng] **E-45704**

Late Cenozoic glacial history of Terra Nova Bay [1990, eng] **E-45903**

Glacial history of the Lambert Glacier [1991, eng] **E-46483**

Polar glacier margin and debris features [1991, eng] **F-45761**

Mass balance of Strandline Glacier [1991, eng] **F-45764**

TEMPERATURE

Underground thermal regime at Terra Nova Bay [1991, eng] **E-45793**

Estimating ice temperature from short records in thermally disturbed boreholes [1991, eng] **F-45545**

Numerical studies of the temperature, ice age and conditions of a glacier bed [1991, rus] **F-46993**

THAWING

Discharge of ice into the Filchner-Ronne ice shelves [1986, eng] **F-45497**

Drainage of the Cazadora Glacier at Juan-Carlos I Base [1991, eng] **F-46844**

Record of the 1988-1989 expedition at the Spanish Juan Carlos I Station [1989, spa] **F-47227**

Correlation between discharge and hydrochemical parameters in the river at Juan Carlos I Station [1989, spa] **F-47228**

Meteorological data and hydrogram of the river at Juan Carlos I Station [1989, spa] **F-47229**

Different water types found in the vicinity of Juan Carlos I Station [1989, spa] **F-47230**

Structural analysis of the Cazadora Glacier ice, directional anisotropy quantification and subglacial drainage prediction [1989, spa] **F-47233**

THICKNESS

Internal layering and bedrock topography of ice stream C [1990, eng] **F-45915**

Glaciochemical investigations in southern Victoria Land [1990, eng] **F-45919**

Glacier fluctuations on South Georgia during the 1970s and early 1980s [1992, eng] **F-46370**

VARIATIONS

Glacial history of the Lambert Glacier [1991, eng] **E-46483**

Modeling glacier fluctuations in the Sör Rondane, Dronning Maud Land, Antarctica [1989, eng] **F-45445**

Glacier fluctuations on South Georgia during the 1970s and early 1980s [1992, eng] **F-46370**

Dynamics of antarctic glaciers in the twentieth century [1991, eng] **F-46660**

Fluctuations of antarctic glaciers and planetary atmospheric processes [1991, eng] **F-46661**

Current state of the regime of glacier systems in the world [1991, rus] **F-46992**

VOLUME

Morphology of ice-catchments in Antarctica [1989, rus] **F-46283**

Gravimetric exploration

Used as subordinate term under various types of ice (snow)

Gravity

Antarctic geoscience transect QML-1A and QML-1B [1991, eng] **C-46462**

Antarctic marine gravity field from high-density satellite altimetry [1992, eng] **C-46572**

Magnetic anomalies over the James Ross Island and surrounding areas [1992, spa] **C-47285**

Correction of the Weddell Sea western margin topography based on aerogravimetric data [1990, spa] **E-45114**

Considerations on the morphology of the western Weddell Sea based on aerogeophysical data [1990, spa] **E-45117**

Structure and evolution of continental margins in the southern ocean [1991, rus] **E-45745**

Magnetism and seismic reflection study in the Ross Sea [1990, eng] **E-45909**

Gravity model of geological structure of the Barton Peninsula [1991, kor] **E-46083**

JARE-32 fieldwork in Sör Rondane Mountains [1991, jpn] **E-46744**

Geophysical study in the northern sector of the Antarctic Peninsula and the Larsen Ice Shelf [1990, spa] **F-45122**

Glaciological data: geodetic measurements [1990, eng] **F-45527**

Accurate gravity air-link between South America and the Antarctic Peninsula [1990, eng] **L-45116**

Comparison between the total geomagnetic field reference values and those measured in the Drake Passage [1990, spa] **L-45123**

Earth crust and effective topography of Antarctica [1989, rus] **L-45253**

Acquisition, processing and preliminary results of the Antarctic 1987-88 geophysical survey [1988, eng] **L-45708**

1988/89 Italian antarctic geophysical survey [1991, eng] **L-45802**

Gravity fields of the southern ocean from Geosat data [1992, eng] **L-46086**

Seismic exploration with penetrator in Queen Maud Land [1991, eng] **L-46195**

Configuration and structure of the subglacial crust [1991, eng] **L-46343**

Crustal structure of the southern Weddell Sea [1992, chi] **L-46893**

Correction to "Gravity fields of the southern ocean from Geosat data" [1992, eng] **L-47360**

Handbooks

Ice

AGE DETERMINATION *(cont.)*

Continuous 770-year record of volcanic activity from East Antarctica [1991, eng] **F-46953**

Changes in tropospheric methane, 1841-1978, from ice core [1992, eng] **I-47242**

1000 years of explosive volcanism recorded at the South Pole [1992, eng] **I-47247**

ALBEDO

Climate characteristics [1989, por] **I-46623**

CHEMICAL PROPERTIES

Ultra-trace analysis of heavy metals in ice and snow from the Antarctic and Greenland [1992, eng] **I-46064**

CHEMISTRY

Ice core studies on the Filchner-Ronne Ice Shelf [1986, eng] **F-45498**

Chemical basis for the electrical stratigraphy of ice [1992, eng] **F-45747**

Spatial and temporal characteristics of the Little Ice Age: the antarctic ice core record [1991, eng] **F-46041**

Paleoenvironmental data from less-investigated polar regions [1991, eng] **F-46042**

Oxygen supersaturation in ice-covered antarctic lakes [1992, eng] **F-46049**

Ion chromatography in snow and ice analyses [1991, eng] **F-46148**

Total gas content in ice cores: paleoaspects [1991, eng] **F-46652**

Last deglaciation in Antarctica [1991, eng] **F-46663**

Late Quaternary glacio-climatic history of an East Antarctic ice sheet margin [1991, eng] **F-46664**

Results of analyses of Mizuho 700 m ice core [1992, eng] **F-46756**

Study of methanesulfonic acid in ice cores [1991, eng] **F-46867**

Continuous 770-year record of volcanic activity from East Antarctica [1991, eng] **F-46953**

Environmental information from ice cores [1992, eng] **F-47222**

Crystallographic analyses of clathrate hydrates included in Vostok ice cores [1992, jpn] **F-47343**

Climate and CO2 levels from Vostok ice core records [1991, eng] **I-45169**

Vostok ice core study of ice volume changes during penultimate deglaciation [1991, eng] **I-45932**

Evidence for an early Holocene climatic optimum in the antarctic deep ice-core record [1992, eng] **I-46136**

Sources of continental dust over Antarctica during the last glacial cycle [1992, eng] **I-46433**

Carbon isotopes in atmospheric CO2 frozen in an ice core [1992, eng] **I-46459**

Changes in tropospheric methane, 1841-1978, from ice core [1992, eng] **I-47242**

Ratio of MSA to non-sea-salt sulphate in Antarctic Peninsula ice cores [1992, eng] **I-47243**

1000 years of explosive volcanism recorded at the South Pole [1992, eng] **I-47247**

Pattern of ocean-atmosphere exchange in a Weddell Sea ice core [1992, eng] **I-47254**

Antarctica Project. Environmental impact: chemical methodologies [1991, eng] **J-46144**

CONSTRUCTION

Laboratory test on construction of ice domes and their load-carrying capacity [1992, jpn] **F-47340**

CORES

Antarctic ice: a remembrance, a passion [1991, fre] **A-46031**

Stages of Late Pleistocene glaciation of Antarctica [1991, rus] **E-45312**

Polar interglacial climatic conditions in McMurdo Sound [1991, eng] **E-45550**

Automatic measurements of the dimensions of crystals [1990, rus] **F-45109**

Repeated compression-annealing experiments on anisotropic core ice [1991, eng] **F-45462**

Ecology of colored fast ice in coastal waters off the Great Wall Station [1991, eng] **F-45463**

Ice core studies on the Filchner-Ronne Ice Shelf [1986, eng] **F-45498**

Ice core drilling on Dolleman Island [1986, eng] **F-45499**

520 year temperature record of a 100 m core from the Ronne Ice Shelf, Antarctica (extended abstract) [1990, eng] **F-45518**

Glaciology of Filchner-Ronne Ice Shelf, 1989/90 [1990, eng] **F-45532**

Sedimentary facies associated with Antarctica's floating ice masses [1991, eng] **F-45549**

Environmental records from polar ice cores [1990, eng] **F-45683**

Be-10 and delta H-2 in polar ice cores [1990, eng] **F-45684**

Solar modulation of cosmic radiation in ice cores [1990, eng] **F-45685**

Why ice-age ice is sometimes "soft" [1991, eng] **F-45746**

Glaciology of Dyer Plateau [1990, eng] **F-45918**

Glaciochemical investigations in southern Victoria Land [1990, eng] **F-45919**

Sea-ice studies on the Winter Weddell Gyre Study, 1989 [1990, eng] **F-46004**

Polar ice cores: climatic and environmental records [1991, eng] **F-46039**

Spatial and temporal characteristics of the Little Ice Age: the antarctic ice core record [1991, eng] **F-46041**

Paleoenvironmental data from less-investigated polar regions [1991, eng] **F-46042**

Soviet glaciological studies in 1988 [1989, rus] **F-46284**

Soviet-French Workshop on the Results of Cores from Antarctic Boreholes, May-June 1989 [1989, rus] **F-46285**

Environmental record comparison of Chinese loess and antarctic ice core [1991, chi] **F-46449**

Ice layer observations in the G6 antarctic ice core [1992, eng] **F-46563**

Climatic significance of ice crystals in an ice core [1992, chi] **F-46596**

Polar ice cores—climatic and environmental records [1991, chi] **F-46597**

Glaciers-ocean-atmosphere interactions [1991, eng] **F-46648**

Global changes over the last climatic cycle from antarctic ice core records [1991, eng] **F-46650**

Greenhouse warming, climate sensitivity and Vostok data [1991, eng] **F-46651**

Total gas content in ice cores: paleoaspects [1991, eng] **F-46652**

Last deglaciation in Antarctica [1991, eng] **F-46663**

Late Quaternary glacio-climatic history of an East Antarctic ice sheet margin [1991, eng] **F-46664**

Results of analyses of Mizuho 700 m ice core [1992, eng] **F-46756**

Firn stratigraphy, density and crystal structure on Law Dome [1991, eng] **F-46848**

Chinese loess and antarctic ice core changes over the last 150,000 years [1991, eng] **F-46849**

Thermal properties of snow/firn on the Law Dome ice cap [1991, eng] **F-46851**

Study of methanesulfonic acid in ice cores [1991, eng] **F-46867**

Continuous 770-year record of volcanic activity from East Antarctica [1991, eng] **F-46953**

Environmental information from ice cores [1992, eng] **F-47222**

Crystallographic analyses of clathrate hydrates included in Vostok ice cores [1992, jpn] **F-47343**

Climate and CO2 levels from Vostok ice core records [1991, eng] **I-45169**

Vostok ice core study of ice volume changes during penultimate deglaciation [1991, eng] **I-45932**

Carbon isotopes in atmospheric CO2 frozen in an ice core [1992, eng] **I-46459**

Climate forcing due to non-sea-salt sulfates [1991, eng] **I-46662**

Simulation of oxygen isotope variations in atmospheric flow [1992, eng] **I-47225**

Changes in tropospheric methane, 1841-1978, from ice core [1992, eng] **I-47242**

Ratio of MSA to non-sea-salt sulphate in Antarctic Peninsula ice cores [1992, eng] **I-47243**

1000 years of explosive volcanism recorded at the South Pole [1992, eng] **I-47247**

Pattern of ocean-atmosphere exchange in a Weddell Sea ice core [1992, eng] **I-47254**

Surface water temperature changes in the high latitudes of the Southern Hemisphere over the last glacial- interglacial cycle [1992, eng] **J-47217**

CRYSTALS

Automatic measurements of the dimensions of crystals [1990, rus] **F-45109**

Repeated compression-annealing experiments on anisotropic core ice [1991, eng] **F-45462**

Structure of polycrystalline initial ice crystals [1992, eng] **F-46393**

Climatic significance of ice crystals in an ice core [1992, chi] **F-46596**
Type of plastic deformation of ice in glacier sheets [1991, eng] **F-46656**
Crystallographic analyses of clathrate hydrates included in Vostok ice cores [1992, jpn] **F-47343**
Balloon-borne CCD sonde for observations of stratospheric ice crystals [1989, eng] **I-46793**
Adsorption of HCl on ice under stratospheric conditions [1992, eng] **I-46875**

DEFORMATION
Glaciological geodesy on Filchner Ice Shelf 1983-86 [1986, eng] **F-45495**
Tidal spectrum underneath antarctic ice shelves [1986, eng] **F-45505**
Ice velocity, flow line, and deformation determination from GPS and Transit at Filchner Ronne Ice Shelf [1990, eng] **F-45517**

DENSITY
Air bubble formation in ice [1992, eng] **F-46562**

DISTRIBUTION
Systems and means of marine radio communication [1990, rus] **G-45231**
Climate-ice interactions [1991, eng] **I-45472**

DRILLING
Ice core drilling on Dolleman Island [1986, eng] **F-45499**
Glaciology of Filchner-Ronne Ice Shelf, 1989/90 [1990, eng] **F-45532**
Study of ice borehole closure by finite element method [1992, eng] **F-47356**

ELECTRICAL PROPERTIES
Status and prospects of studies of ice and ocean physics [1991, rus] **F-45307**
Chemical basis for the electrical stratigraphy of ice [1992, eng] **F-45747**
Results of analyses of Mizuho 700 m ice core [1992, eng] **F-46756**
Soviet glaciological studies in 1990 [1991, rus] **F-47013**

FLOW
Repeated compression-annealing experiments on anisotropic core ice [1991, eng] **F-45462**
Ice rises and ice rumples [1986, eng] **F-45491**
Glaciological study of the Rutford Ice Stream [1986, eng] **F-45494**

FORMATION
Ice-damming and fluvial erosion in the Vestfold Hills [1992, eng] **E-46371**
Paleoenvironmental data from less-investigated polar regions [1991, eng] **F-46042**
Evidence for basal marine ice in the Filchner-Ronne ice shelf [1992, eng] **F-46739**

HEAT EXCHANGE
George VI Ice Shelf: a temperate ice shelf [1986, eng] **F-45500**

INSTRUMENTS
Nutrients in sea ice and underlying layer of McMurdo Sound [1990, eng] **B-46264**
Observation of ice features using moonlight as an illumination source [1991, eng] **C-45078**
Digital database of remotely sensed data for glacial study in Antarctica [1990, eng] **F-45063**
Ultratrace determination of cadmium in polar snow and ice [1991, eng] **F-45236**
Ice core drilling on Dolleman Island [1986, eng] **F-45499**
Unmanned submersibles: the development of AUTOSUB within NERC, UK [1990, eng] **F-45524**
Hot water drilling in ice shelf/ocean boundary studies [1990, eng] **F-45534**
Glaciological and oceanographic studies on the Fimbul Ice Shelf, 1989-1990 [1990, eng] **F-45536**
Estimating ice temperature from short records in thermally disturbed boreholes [1991, eng] **F-45545**
Chemical basis for the electrical stratigraphy of ice [1992, eng] **F-45747**
Geophysical experiments in ice stream B boreholes [1990, eng] **F-45914**
Brightness temperature measurements in the Weddell Sea ice [1990, eng] **F-46006**
Space radar observation of the dynamics of the ice coast and the drift of icebergs in the Antarctic [1992, eng] **F-46107**
Sea ice: a cast technique to examine and analyze brine pockets and channel structure [1992, eng] **F-46498**
Determination of methane concentration in air extracted from antarctic ice core samples [1991, eng] **F-46688**
Coherent Antarctic Radar Depth Sounder (CARDS) design, development and results [1989, eng] **F-46999**
Video atlas of TOMS ozone data, 1978-88 [1989, eng] **I-45691**
Ultra-trace analysis of heavy metals in ice and snow from the Antarctic and Greenland [1992, eng] **I-46064**
Satellite remote sensing of the polar oceans [1991, eng] **J-45946**

MAPS AND CHARTS
Image processing techniques applied to LANDSAT MSS images of Victoria Land, Antarctica [1988, eng] **C-45705**
Variations of ice cliff margin of Strandline Glacier, 1987-1988 [1988, eng] **E-45704**
JARE-32 fieldwork in Sör Rondane Mountains [1991, jpn] **E-46744**
Relict flow stripes on the Ross Ice Shelf [1991, eng] **F-45348**
Comparisons of SSM/I and Landsat imagery for determination of sea ice concentrations [1991, eng] **F-45364**
Basal stress distribution of ice stream E, Antarctica inferred by control methods [1992, eng] **F-45447**
Glaciological study of the Rutford Ice Stream [1986, eng] **F-45494**
Satellite image maps as a tool for glaciology [1986, eng] **F-45496**
NARE 1984-1985 glaciological research [1986, eng] **F-45501**
Finite element modelling of the Filchner-Ronne Ice Shelf [1986, eng] **F-45507**
Surface undulations where Rutford Ice Stream enters Ronne Ice Shelf [1990, eng] **F-45516**
Glacial geodetic investigations on Filchner-Ronne Ice Shelf 1989/90 [1990, eng] **F-45522**
Satellite image map series of Filchner-Ronne Ice Shelf 1:2,000,000 [1990, eng] **F-45528**
Satellite image maps of Filchner Ice Shelf at 1:250,000 scale [1990, eng] **F-45529**
Digital Antarctic Coastline [1990, eng] **F-45530**
MSSL Science Plan [1990, eng] **F-45531**
Sedimentary facies associated with Antarctica's floating ice masses [1991, eng] **F-45549**

Development and low temperature test of the generator of a wind turbine system for Antarctica [1991, eng] **G-46065**
Accident and risk evaluation on Finnish antarctic expeditions [1992, eng] **H-46072**
Upper atmosphere data recording at Belgrano II Station [1990, spa] **K-45136**

ON MAN

Design and building practices for southern polar regions [1991, eng] **G-46095**
Human work adaptation to antarctic rough weather [1990, spa] **H-45130**
IBEA's research program and its implications for outer space research [1990, eng] **H-45275**
IBEA: physiological studies in the field [1990, eng] **H-45291**
Results and prospects of medical studies [1991, rus] **H-45310**
Environmental effects on the health of antarctic wintering personnel [1991, eng] **H-45337**
Accident and risk evaluation on Finnish antarctic expeditions [1992, eng] **H-46072**
Changes in thyroid hormone status with antarctic residence [1990, eng] **H-46320**
Stress during winter isolation [1990, eng] **H-46998**

Luminescence

Used as subordinate term under various types of ice (snow)

Magnetic activity

See: Geomagnetic disturbances/Activity indices

Magnetic anomalies

See: Geomagnetic field/Anomalies

Magnetic bays

See: Geomagnetic disturbances/Bays and pulsations

Magnetic exploration

Used as subordinate term under various types of ice (snow)

Magnetic field (in space)

Linear transformations in the polar upper atmosphere [1991, spa] **K-45082**
Collective response from various antarctic stations [1991, spa] **K-45083**
Space research in Antarctica [1990, por] **K-45135**
Magnetospheric response to the passages across the heliographic current [1990, eng] **K-45142**
Transpolar arcs in both polar caps [1991, eng] **K-45741**
Prediction of geomagnetic activity at high austral latitudes [1990, eng] **K-46187**
Electron and ion precipitation in polar regions and interplanetary magnetic field [1992, eng] **K-46586**
See [also]: Geomagnetic field; Magnetosphere

Magnetic poles

See under: Geomagnetic field. *See also:* Polar wandering

Magnetic storms

Maintenance
Used as subordinate term

Mammalia
Subantarctic Macquarie Island: environment and biology [1990, eng] **B-45304**
BREEDING CYCLES AND REPRODUCTION
Hunting wild cats on Marion Island [1991, eng] **B-46767**
ECOLOGY
Spring distribution of seabirds and mammals in the Weddell Sea [1991, eng] **B-45354**
EXPLOITATION
Managing the krill fishery [1991, eng] **B-47312**
GEOGRAPHIC DISTRIBUTION
Hunting wild cats on Marion Island [1991, eng] **B-46767**
MORPHOLOGY
Placental mammal from the Eocene of West Antarctica [1992, eng] **E-45858**
NUTRITION
Spring distribution of seabirds and mammals in the Weddell Sea [1991, eng] **B-45354**
POPULATION
Spring distribution of seabirds and mammals in the Weddell Sea [1991, eng] **B-45354**
Control of feral cats on Marion I. [1992, eng] **B-46573**
TAXONOMY
Placental mammal from the Eocene of West Antarctica [1992, eng] **E-45858**

Mammalia-Cetacea
Sea guide to whales of the world [1981, eng] **B-47333**
ECOLOGY
Food consumption of southern minke whales [1991, eng] **B-45359**
EXPLOITATION
See [also]: Whaling
GEOGRAPHIC DISTRIBUTION
Sightings of *Eubalaena australis* in Chilean waters, 1983-1989 [1992, spa] **B-46936**
MIGRATION
Sightings of *Eubalaena australis* in Chilean waters, 1983-1989 [1992, spa] **B-46936**
MORPHOLOGY
External measurements and allometry of southern sei whale foetuses [1990, eng] **B-46856**
NUTRITION
Food consumption of southern minke whales [1991, eng] **B-45359**
Top predators of the confluence and marginal ice zones [1992, eng] **B-46385**
PATHOLOGY
Parasite fauna as potential stock indicators of antarctic whales [1991, eng] **B-45757**
PHYSIOLOGY
Top predators of the confluence and marginal ice zones [1992, eng] **B-46385**
POPULATION
Parasite fauna as potential stock indicators of antarctic whales [1991, eng] **B-45757**
Top predators of the confluence and marginal ice zones [1992, eng] **B-46385**
Increases in penguin population related to sea ice cover changes [1992, eng] **B-46820**

Mammalia-Pinnipedia
BEHAVIOR
Diving behavior of adult southern elephant seals [1991, eng] **B-46637**
Behavior and breeding frequency of male Weddell seals [1992, eng] **B-46974**
Fostering behaviour and milk stealing in antarctic fur seals [1992, eng] **B-46975**
Acoustic tracking system for monitoring under-ice movements of polar seals [1992, eng] **B-47298**
Foraging ecology of southern elephant seals [1992, eng] **B-47320**
Monitoring the feeding behavior of free diving Weddell seals [1992, ger] **B-47334**
BLOOD AND CIRCULATION
Hematology and red blood cell metabolism in *Mirounga leonina* [1991, eng] **B-45585**
Biochemistry of Weddell seal blood [1992, eng] **B-46759**
Hemorheological behavior of seal blood [1992, eng] **B-46985**
BREEDING CYCLES AND REPRODUCTION
Factors controlling the reproductive cycles of pinnipeds [1991, eng] **B-45085**
Molecular population genetics of the southern elephant seal, *Mirounga leonina* [1991, eng] **B-45587**
Analysis of the milk fat of the fur seal *Arctocephalus gazella* [1992, eng] **B-46918**
Behavior and breeding frequency of male Weddell seals [1992, eng] **B-46974**
Fostering behaviour and milk stealing in antarctic fur seals [1992, eng] **B-46975**
ECOLOGY
Acoustic tracking system for monitoring under-ice movements of polar seals [1992, eng] **B-47298**
EMBRYOLOGY
Factors controlling the reproductive cycles of pinnipeds [1991, eng] **B-45085**
EXPLOITATION
See [also]: Sealing
GEOGRAPHIC DISTRIBUTION
Distributions and predator-prey interactions near Bird Island [1992, eng] **B-47290**
MARKING
Extracting teeth in live seals for age determination [1992, eng] **B-46914**
MIGRATION
Southern elephant seal foraging in the southern ocean [1991, eng] **B-45580**
Acoustic tracking system for monitoring under-ice movements of polar seals [1992, eng] **B-47298**
MORPHOLOGY
Vesicles in the proboscis of Acanthocephala [1990, eng] **B-46717**
NUTRITION
Fur seal autumn-winter diet around Heard I. [1991, eng] **B-45219**
Multispecies seabird flocks around South Georgia [1991, eng] **B-45261**
Food consumption by predators in a CCAMLR Integrated Study Region [1991, eng] **B-45439**
Scientific investigations of the National Marine Mammal Laboratory, 1990 [1992, eng] **B-45555**
Southern elephant seal foraging in the southern ocean [1991, eng] **B-45580**
Parasitic nematode life cycles [1992, eng] **B-46363**
Top predators of the confluence and marginal ice zones [1992, eng] **B-46385**
Diving behavior of adult southern elephant seals [1991, eng] **B-46637**
Diet of antarctic fur seals at Mossman Peninsula [1992, eng] **B-46823**
Foraging ecology of southern elephant seals [1992, eng] **B-47320**
Monitoring the feeding behavior of free diving Weddell seals [1992, ger] **B-47334**
PATHOLOGY
Chlorobiphenyls and organochlorine pesticides in various sub-antarctic organisms [1991, eng] **B-45340**
Antibodies against phocine herpesvirus in sera of seals [1991, eng] **B-45363**
Parasitic nematode life cycles [1992, eng] **B-46363**
Vesicles in the proboscis of Acanthocephala [1990, eng] **B-46717**
Morphological distinction between nematodes from the Weddell seal [1992, eng] **B-47219**

PHYSIOLOGY
Factors controlling the reproductive cycles of pinnipeds [1991, eng] **B-45085**
Antibodies against phocine herpesvirus in sera of seals [1991, eng] **B-45363**
Hematology and red blood cell metabolism in *Mirounga leonina* [1991, eng] **B-45585**
Molecular population genetics of the southern elephant seal, *Mirounga leonina* [1991, eng] **B-45587**
Top predators of the confluence and marginal ice zones [1992, eng] **B-46385**
Extracting teeth in live seals for age determination [1992, eng] **B-46914**
Analysis of the milk fat of the fur seal *Arctocephalus gazella* [1992, eng] **B-46918**
Animal diet and trophic structure in the Weddell Sea [1992, eng] **B-46920**
Behavior and breeding frequency of male Weddell seals [1992, eng] **B-46974**
Metabolic rate of diving Weddell seals [1992, eng] **B-47113**
Foraging ecology of southern elephant seals [1992, eng] **B-47320**
Monitoring the feeding behavior of free diving Weddell seals [1992, ger] **B-47334**
POPULATION
Continued population increase of PEI fur seals [1990, eng] **B-45068**
Multispecies seabird flocks around South Georgia [1991, eng] **B-45261**
Southern elephant seal foraging in the southern ocean [1991, eng] **B-45580**
Birds and mammals at SSSI No.8, Admiralty Bay [1991, eng] **B-45732**
Top predators of the confluence and marginal ice zones [1992, eng] **B-46385**

Mantle studies
Evolution of the subcontinental lithospheric mantle of Antarctica [1991, eng] **E-45787**
Basanite to tephrite lavas from Melbourne volcanic province [1991, eng] **E-45789**
Causative process for fragmentation in western Gondwana [1992, eng] **E-46676**
Bimodal magmatism in northeast Palmer Land [1992, eng] **E-47142**
Seismic radiation from Macquarie Ridge earthquake [1991, eng] **L-45168**
Phased peridotites from a continental rift system [1992, eng] **L-46768**

Meltwater
Limnological properties of antarctic ponds during winter freezing [1991, eng] **B-45222**
Persistent pesticides in fresh waters [1991, eng] **B-46168**
Geochemistry of trace elements in the surface waters of Terra Nova Bay (Antarctica) [1991, eng] **E-45795**
Subglacial meltwater system, Sessrumir Valley [1990, eng] **E-45905**
Holocene meltwater variations recorded in antarctic coastal marine benthic assemblages [1991, eng] **E-46034**
Changes in the west antarctic ice sheet [1991, eng] **F-45077**
Stable isotopes in antarctic ice: glaciological implications [1991, eng] **F-45760**

Meltwater *(cont.)*
Implications of lake ice cover thickness change for local climatology [1992, eng] **F-46437**
Drainage of the Cazadora Glacier at Juan-Carlos I Base [1991, eng] **F-46844**
Correlation between discharge and hydrochemical parameters in the river at Juan Carlos I Station [1989, spa] **F-47228**
Meteorological data and hydrogram of the river at Juan Carlos I Station [1989, spa] **F-47229**
Different water types found in the vicinity of Juan Carlos I Station [1989, spa] **F-47230**
Structural analysis of the Cazadora Glacier ice, directional anisotropy quantification and subglacial drainage prediction [1989, spa] **F-47233**
CHEMISTRY
Chromatographic analysis of reduced sulfur gases in antarctic waters following pre-concentration onto Tenax [1992, eng] **E-46687**
Mineralogic and microsonde analysis of volcanic ash in the vicinity of Juan Carlos I Station [1989, spa] **E-47234**

Mesosphere
Ozone hole: three-dimensional model of the middle atmosphere [1991, eng] **I-45255**
Effect of magnetic activity on the neutral atmosphere [1990, rus] **I-45664**
Evaluation of the zonal structure of the antarctic atmosphere and its annual dynamics [1990, rus] **I-45667**
Thermodynamic parameter models of the southern mesosphere [1990, rus] **I-45676**
Interhemispheric differences in large-scale atmospheric processes [1990, rus] **I-45678**
Planetary wave energy and atmospheric thermodynamic regime in winter [1990, rus] **I-45680**
Strato-mesospheric processes over the Southern Hemisphere in winter 1985 [1990, rus] **I-45681**
Wind and temperature in the South Pole mesosphere [1992, eng] **I-45751**
Influence of planetary wave dynamics on polar ozone photochemistry [1992, eng] **I-46588**
Large-scale waves in the antarctic mesosphere [1992, eng] **I-46874**
South Pole mesospheric and lower-thermospheric dynamics [1990, eng] **K-46513**

Metamorphism
Used as subordinate term under various types of ice (snow)

Meteorites
See: Extraterrestrial material

Meteorological observations

INSTRUMENTS
High-flying probe: *Perseus* to sail into the ozone [1992, eng] **A-45882**
Snowfall and snow clouds at Showa Station [1992, eng] **F-46555**
Nimbus-7 TOMS Antarctic Ozone Atlas: August through December 1990 [1991, eng] **I-45103**
JARE-30 Polar Patrol Balloon experiment, 1989-1990 [1991, eng] **I-45179**
Observations of the ozone hole by the Polar Patrol Balloon in 1991 [1991, eng] **I-45182**
Measurement of ozone by a space shuttle sunphotometer [1991, eng] **I-45484**
Video atlas of TOMS ozone data, 1978-88 [1989, eng] **I-45691**
Mesosphere 12 h wave over the South Pole [1992, eng] **I-45753**
Polar automatic weather station project of the University of Wisconsin [1991, eng] **I-45983**
Carbon oxides and hydrogen in antarctic atmosphere [1991, eng] **I-46155**
Tropospheric concentration of halocarbons [1991, eng] **I-46159**
Ozone and cloud properties from ultraviolet-monitor measurements at Palmer Station [1990, eng] **I-46322**
Infrared atmospheric absorption and emission measurements [1990, eng] **I-46324**
Nitrous oxide and halocarbon measurements [1990, eng] **I-46328**
Microbarograph for internal gravity wave studies [1992, eng] **I-46374**
Meteorological data from the Langhovde Hills, summers of 1978-1989 [1992, eng] **I-46467**
Antarctic atmospheric circulation and tropospheric and stratospheric transport processes [1992, eng] **I-46550**
Radiometer/spectrometer system for observation of upper atmosphere chemistry [1992, eng] **I-46551**
Atmospheric methane measurements at Showa Station [1992, eng] **I-46552**
Analysis of MOS-1 MSR data received at Syowa Station, Antarctica [1992, eng] **I-46564**
PPI radar data at Showa Station, Feb.-Dec. 1989 [1992, eng] **I-46593**
Meteorological data from Asuka Station, 1990 [1992, eng] **I-46594**
Meteorological measurements using drifting buoys [1989, eng] **I-46627**
Meteorological facilities at Terra Nova Bay Station [1989, eng] **I-46780**
Some air temperature patterns recorded at Terra Nova Bay during winter 1987 [1989, eng] **I-46781**
Atmospheric turbidity measurements at Terra Nova Bay during Jan. and Feb. 1988 [1989, eng] **I-46782**
Characterization of aerosol at Terra Nova Bay, Antarctica [1989, eng] **I-46784**
Acoustic remote sensing of the antarctic boundary layer [1989, eng] **I-46788**
Radio acoustic measurement of tropospheric vertical thermal profile [1989, eng] **I-46789**
Stratospheric clouds at South Pole, winter 1988 [1989, eng] **I-46790**
Application of lidar for the antarctic stratospheric research [1989, eng] **I-46791**
Balloon-borne CCD sonde for observations of stratospheric ice crystals [1989, eng] **I-46793**
Stratospheric gas absorption measurements [1989, eng] **I-46795**
Ozone measurements at Terra Nova Bay [1989, eng] **I-46796**
Meteorological data at Showa Station, 1989 [1992, eng] **I-46899**
Meteorological data at Showa and Asuka stations, 1990 [1992, eng] **I-46900**
Lidar observations of stratospheric clouds at South Pole [1992, eng] **I-47145**
Stratospheric clouds at South Pole during 1988 [1992, eng] **I-47146**
Condensation nuclei at Georg von Neumayer Station [1992, eng] **I-47245**
Wind field observations by sodar system and AWS on the Nansen Ice Sheet [1992, eng] **I-47253**
Focused sun observations using a Brewer ozone spectrophotometer [1992, eng] **I-47350**
Ocean currents in Discovery Bay [1990, spa] **J-46691**
MAPS AND CHARTS
Stratospheric ozone in the 21st century. The chlorofluorocarbon problem [1991, eng] **I-45099**
Nimbus-7 TOMS Antarctic Ozone Atlas: August through December 1990 [1991, eng] **I-45103**
Annual cycle in antarctic and middle south latitudes [1990, eng] **I-45126**
Total column abundances of atmospheric carbon monoxide and methane [1991, eng] **I-45227**
Climatic zoning of polar regions by cluster analysis [1990, rus] **I-45244**
Ozone hole: three-dimensional model of the middle atmosphere [1991, eng] **I-45255**
New data on the south polar region climate in the Antarctic Atlas [1990, rus] **I-45632**
Radiation climate in the Antarctic [1990, rus] **I-45633**
Frequency of precipitation in the Antarctic [1990, rus] **I-45638**
Climate of West Antarctica [1990, rus] **I-45644**
Prevailing surface wind in Antarctica [1990, rus] **I-45645**

Atmospheric geopotential variations, 1958-1985 [1990, rus] **I-45660**
Unfavorable weather conditions for air navigation during summer [1990, rus] **I-45671**

Models

Greenhouse warming, climate sensitivity and Vostok data [1991, eng] F-46651
Used as subordinate term under broad subject categories (see p. V)

OCEANOGRAPHY
Impact of nutrient depletion on atmospheric CO2 and ocean chemistry [1991, eng] B-46295

Mollusca

Fur seal autumn-winter diet around Heard I. [1991, eng] B-45219
Diet of antarctic fur seals at Mossman Peninsula [1992, eng] B-46823
Antarctic Mollusca, with special reference to the fauna of the Ross Sea [1990, eng] B-46948
Terrestrial invertebrate fauna of Macquarie I. [1990, eng] B-47006
Ecology of Kelp Gulls *(Larus dominicanus)* on Anvers I. [1989, eng] B-47121
Late Cretaceous ammonite assemblages of the Santa Marta Formation, James Ross Island [1992, spa] E-47276
Fauna of Cabo Polanski, James Ross Island [1992, spa] E-47281
Molluscan biostratigraphy, La Meseta Formation, Seymour I. [1992, eng] E-47299

BEHAVIOR
Molluscs from high antarctic shelf areas [1992, eng] B-46836

BREEDING CYCLES AND REPRODUCTION
Molluscs from high antarctic shelf areas [1992, eng] B-46836
Lissarca notorcadensis (Bivalvia: Philobryidae) in the Weddell Sea [1992, eng] B-46919
Reproductive ecology of the antarctic bivalve *Lissarca notorcadensis* (Philobryidae) [1992, eng] B-47365

ECOLOGY
Polymorphism of mitochondrial DNA in subantarctic mussels [1990, eng] B-45165
Shelf and slope molluscan fauna distribution in the Weddell Sea [1992, eng] B-46386
Benthic Mollusca of Marion and Prince Edward Is. [1991, eng] B-47166
Geochemical study of inoceramid bivalves from James Ross I. [1990, eng] E-45098
Holocene meltwater variations recorded in antarctic coastal marine benthic assemblages [1991, eng] E-46034

EMBRYOLOGY
Lissarca notorcadensis (Bivalvia: Philobryidae) in the Weddell Sea [1992, eng] B-46919

EXPLOITATION
Discards from squid trawlers as food for Falkland Is. albatrosses [1992, eng] B-45720
Post-recruit growth of the Patagonian squid *Loligo gahi* (d'Orbigny) [1991, eng] B-46960

GEOGRAPHIC DISTRIBUTION
Terrestrial slug recorded from sub-antarctic Marion Island [1992, eng] B-45612
Allozymes and morphometric characteristics in three *Mytilus* species [1991, eng] B-45721
Shelf and slope molluscan fauna distribution in the Weddell Sea [1992, eng] B-46386
Two new monoplacophorans from the Antarctic [1992, eng] B-46839
Archaeogastropods from Breid Bay [1992, eng] B-47040

MIGRATION
Polymorphism of mitochondrial DNA in subantarctic mussels [1990, eng] B-45165

MORPHOLOGY
Nudibranch molluscs from the Ross Sea [1991, eng] B-45394
New notaspidean genus and species from the Weddell Sea [1991, eng] B-45395
Variations in an antarctic limpet [1991, eng] B-45605
Allozymes and morphometric characteristics in three *Mytilus* species [1991, eng] B-45721
Possible new brachiopod from Seymour I. [1991, eng] B-45755
Two new monoplacophorans from the Antarctic [1992, eng] B-46839
Metal binding sites in kidney of scallop [1992, eng] B-46941
Post-recruit growth of the Patagonian squid *Loligo gahi* (d'Orbigny) [1991, eng] B-46960
Benthic Mollusca of Marion and Prince Edward Is. [1991, eng] B-47166
Reproductive ecology of the antarctic bivalve *Lissarca notorcadensis* (Philobryidae) [1992, eng] B-47365

NUTRITION
Diet of antarctic squid: comparison of conventional and serological gut contents analyses [1992, eng] B-46407

PATHOLOGY
Intertidal zone at Palmer Station after the *Bahia Paraiso* spill [1990, eng] B-46272

PHYSIOLOGY
Polymorphism of mitochondrial DNA in subantarctic mussels [1990, eng] B-45165
Physiology and population of the ascidian *Cnemidocarpa verrucosa* Lesson [1991, eng] B-45178
New glycerides from an antarctic nudibranch [1991, eng] B-45485
Variations in an antarctic limpet [1991, eng] B-45605
Metal contents in tissues of *Adamussium colbecki* and role of metallothioneins in detoxification of heavy metals [1990, ita] B-46132
Adamussium colbecki and heavy metals in the Ross Sea [1990, ita] B-46133
Mercury and selenium in mollusca and fish from the Ross Sea [1991, eng] B-46150
Diet of antarctic squid: comparison of conventional and serological gut contents analyses [1992, eng] B-46407
Biochemistry and energy content in shallow-water gastropods [1992, eng] B-46830
Lissarca notorcadensis (Bivalvia: Philobryidae) in the Weddell Sea [1992, eng] B-46919
Metal binding sites in kidney of scallop [1992, eng] B-46941
Post-recruit growth of the Patagonian squid *Loligo gahi* (d'Orbigny) [1991, eng] B-46960

POPULATION
Physiology and population of the ascidian *Cnemidocarpa verrucosa* Lesson [1991, eng] B-45178
Population structure of cephalopods in the subantarctic South Atlantic [1991, eng] B-46300
Shelf and slope molluscan fauna distribution in the Weddell Sea [1992, eng] B-46386
Holocene meltwater variations recorded in antarctic coastal marine benthic assemblages [1991, eng] E-46034

TAXONOMY
Nudibranch molluscs from the Ross Sea [1991, eng] B-45394
New notaspidean genus and species from the Weddell Sea [1991, eng] B-45395
Allozymes and morphometric characteristics in three *Mytilus* species [1991, eng] B-45721
Possible new brachiopod from Seymour I. [1991, eng] B-45755
Two new monoplacophorans from the Antarctic [1992, eng] B-46839
Archaeogastropods from Breid Bay [1992, eng] B-47040
Benthic Mollusca of Marion and Prince Edward Is. [1991, eng] B-47166
Marocella: antarctic specimens of an enigmatic Cambrian animal [1992, eng] E-47129

Ageing studies on the early life stages of antarctic fishes [1990, eng] **B-46279**
Neutral lipid compositions in antarctic fish tissues [1992, eng] **B-46297**
Age of juvenile *Notothenia rossii* from Potter Cove [1992, eng] **B-46358**
Review of antarctic and subantarctic green notothenias [1992, eng] **B-46406**
Taxonomy of *Gobionotothen angustifrons sandwichensis* [1992, eng] **B-46477**
Anatomy and histology of *Notothenia rossi marmorata* [1992, eng] **B-46478**
Antarctic rock cod genus *Nototheniops* from the Indian Ocean [1992, eng] **B-46479**
Circumcontinental distribution of antarctic plunderfish [1992, eng] **B-46480**
Morphological adaptation and mode of life in high antarctic fish [1991, eng] **B-46528**
Age determination in antarctic fish [1991, eng] **B-46532**
Fossil and modern fish faunas [1991, eng] **B-46534**
Sensory biology of notothenioid fish [1991, eng] **B-46536**
Heart of the icefish *Chionodraco hamatus* (Lönnberg) [1991, eng] **B-46540**
Icefish superoxide dismutase [1990, eng] **B-46799**
Gametogenesis and sexual cycles in notothenioids from East Antarctica [1992, eng] **B-46829**
Anotopterus pharao, a fish associated with krill [1992, eng] **B-47033**
Biology and physiological ecology of notothenioid fishes [1990, eng] **B-47059**
Structure of otoliths and their use as identifying tools [1990, eng] **B-47061**
Introduction to the systematics section [1990, eng] **B-47062**
Myxinidae: Hagfishes [1990, eng] **B-47063**
Petromyzontidae: Lampreys [1990, eng] **B-47064**
Sharks: Lamnidae, Mackerel sharks; Squalidae, Spiny dogfishes [1990, eng] **B-47065**
Rajidae: Skates [1990, eng] **B-47066**
Halosauridae: Halosaurs [1990, eng] **B-47067**
Notocanthidae: Spiny eels [1990, eng] **B-47068**
Synaphobranchidae: Synaphobranchiids [1990, eng] **B-47069**

Microstomatidae: Microstomatids [1990, eng] **B-47070**
Bathylagidae: Deepsea smelts [1990, eng] **B-47071**
Alepocephalidae: Slickheads [1990, eng] **B-47072**
Platytroctidae: Tubeshoulders [1990, eng] **B-47073**
Gonostomatidae: Bristlemouths [1990, eng] **B-47074**
Sternoptychidae: Hatchetfishes [1990, eng] **B-47075**
Stomiidae: Scaly dragonfishes [1990, eng] **B-47076**
Scopelarchidae: Pearleyes [1990, eng] **B-47077**
Notosudidae: Notosudids [1990, eng] **B-47078**
Paralepididae: Barracudinas [1990, eng] **B-47079**
Anotopteridae: Daggertooths [1990, eng] **B-47080**
Alepisauridae: Lancetfishes [1990, eng] **B-47081**
Family Myctophidae: Lanternfishes [1990, eng] **B-47082**
Muraenolepididae: Eel cods [1990, eng] **B-47083**
Moridae: Deepsea cods [1990, eng] **B-47084**
Melanonidae: Melanonids [1990, eng] **B-47085**
Gadidae: Cods [1990, eng] **B-47086**
Macrouridae: Grenadiers [1990, eng] **B-47087**
Ophidiidae: Cuskeels [1990, eng] **B-47088**
Carapidae: Pearlfishes [1990, eng] **B-47089**
Caratiidae: Seadevils [1990, eng] **B-47090**
Oneirodidae: Dreamers [1990, eng] **B-47091**
Melanocetidae: Devil-anglers [1990, eng] **B-47092**
Lampridae: Opahs [1990, eng] **B-47093**
Melamphaidae: Bigscale fishes [1990, eng] **B-47094**
Cetomimidae: Whalefishes [1990, eng] **B-47095**
Oreosomatidae: Oreos [1990, eng] **B-47096**
Congiopodidae: Horsefishes [1990, eng] **B-47097**
Liparididae: Snailfishes [1990, eng] **B-47098**
Zoarcidae: Eelpouts [1990, eng] **B-47099**
Bovichtidae: Thornfishes [1990, eng] **B-47100**
Nototheniidae: Notothens [1990, eng] **B-47101**
Artedidraconidae: Plunderfishes [1990, eng] **B-47102**
Harpagiferidae: Spiny plunderfishes [1990, eng] **B-47103**
Bathydraconidae: Dragonfishes [1990, eng] **B-47104**
Channichthyidae: Icefishes [1990, eng] **B-47105**
Tripterygiidae: Triplefins [1990, eng] **B-47106**
Gempylidae: Snake mackerels [1990, eng] **B-47107**
Scombridae: Tunas [1990, eng] **B-47108**
Centrolophidae: Driftfishes [1990, eng] **B-47109**
Achiropsettidae: Southern flounders [1990, eng] **B-47110**
Amino acid sequence of the single hemoglobin fish *Bathydraco marri* Norman [1992, eng] **B-47218**
Function and structure of fish brain and egg tubulins [1992, eng] **B-47373**
New fossil agnathan from Aztec Siltstone, Victoria Land [1992, eng] **E-45857**
Fossil fishes from Antarctica [1991, eng] **E-46349**

NUTRITION
Feeding and food intake of *Electrona carlsbergi* (Tåning, 1932) myctophidae [1991, eng] **B-45433**
Mesopelagic fish of the southern ocean from recent Soviet studies [1991, eng] **B-45435**
Life cycle of *Trematomus eulepidotus* (Nototheniidae) in the Indian Ocean [1991, eng] **B-45600**
Feeding stimulation in sea bream fed on krill diets [1990, eng] **B-45711**
Introduction and extinction of trout in subantarctic stream [1992, eng] **B-45847**
Demersal fish communities of South Georgia [1991, eng] **B-45934**
Morphology of notothenioids and cottoids [1990, eng] **B-46278**
Anatomy and histology of *Notothenia rossi marmorata* [1992, eng] **B-46478**
Winter ichthyoplankton community off the Antarctic Peninsula [1991, eng] **B-46815**
Nutrition of an ichthyoplankter in pelagic antarctic waters [1992, eng] **B-47260**
Feeding behavior of juvenile notothenioids in Prydz Bay and off Enderby Land [1992, eng] **B-47261**

PATHOLOGY
Chlorobiphenyls and organochlorine pesticides in various sub-antarctic organisms [1991, eng] **B-45340**
Fish parasites in the Antarctic and near South Georgia [1991, eng] **B-45733**
Parasite infection of fish at South Georgia [1992, eng] **B-45853**
Genetic structure of endoparasitic nematodes and their hosts; adaptive processes [1990, ita] **B-46124**
Heavy metal contamination and adaptation to dissolved oxygen increases in fish [1990, ita] **B-46128**
Levels of chlorinated hydrocarbons and mixed function oxidase activity in antarctic organisms [1990, ita] **B-46131**
Pesticides in fish from the Ross Sea [1992, eng] **B-46360**
Parasitic nematode life cycles [1992, eng] **B-46363**
Acanthocephalan infection in fish at South Georgia [1992, eng] **B-46367**
Biochemistry and energy content in shallow-water gastropods [1992, eng] **B-46830**

PHYSIOLOGY
Heart ventricle of the haemoglobinless icefish *Chaenocephalus aceratus* [1991, eng] **B-45086**
Age determination of *Champsocephalus gunnari* Lönnberg, 1905 at South Georgia [1991, eng] **B-45426**
Natural mortality rate of *Champsocephalus gunnari,* South Georgia [1991, eng] **B-45428**
On reproduction of *Electrona carlsbergi* (Tåning) [1991, eng] **B-45432**
Age and growth of the antarctic fish *Nototheniops nudifrons* [1990, eng] **B-45486**
Life cycle of *Trematomus eulepidotus* (Nototheniidae) in the Indian Ocean [1991, eng] **B-45600**
Life under extreme conditions: biochemical adaptation [1991, eng] **B-45624**
Role of antifreeze proteins in the freezing avoidance of cold water fish [1991, eng] **B-45625**
Structure and functions of hemoglobins in an antarctic teleost [1991, eng] **B-45626**
Cold-stable microtubules from antarctic fish [1991, eng] **B-45627**
Ventricular myocardium of the icefish *Chaenocephalus aceratus* [1983, eng] **B-45712**
Karyotypes of two Channichthyidae from Prydz Bay [1987, eng] **B-45713**
Renin-angiotensin system in antarctic fishes [1991, eng] **B-45728**
Amino acids and oxygen-binding properties of an antarctic teleost [1992, eng] **B-45841**
Introduction and extinction of trout in subantarctic stream [1992, eng] **B-45847**
Blood physiology and ecological consequences in Weddell Sea fishes [1991, eng] **B-45864**
Heart performance of an antarctic icefish [1991, eng] **B-45939**
Evidence of protandry in a subantarctic notothenid [1992, eng] **B-46054**
Genetic structure of endoparasitic nematodes and their hosts; adaptive processes [1990, ita] **B-46124**
Low temperature adaptation in antarctic teleosts [1990, ita] **B-46127**
Heavy metal contamination and adaptation to dissolved oxygen increases in fish [1990, ita] **B-46128**
Heart of haemoglobin-free teleosts [1990, ita] **B-46129**
Enzymatic adaptation to low temperatures in antarctic teleosts [1990, ita] **B-46130**
Levels of chlorinated hydrocarbons and mixed function oxidase activity in antarctic organisms [1990, ita] **B-46131**
Regulation of the gene hsp70 in antarctic fish [1990, ita] **B-46134**
Mercury and selenium in mollusca and fish from the Ross Sea [1991, eng] **B-46150**
Ageing studies on the early life stages of antarctic fishes [1990, eng] **B-46279**
Microtubule stabilizing in fish [1990, eng] **B-46280**
Neutral lipid compositions in antarctic fish tissues [1992, eng] **B-46297**
Ecology of the fish in Weddell Sea [1992, ger] **B-46354**
Age of juvenile *Notothenia rossii* from Potter Cove [1992, eng] **B-46358**
Pesticides in fish from the Ross Sea [1992, eng] **B-46360**
Oxygen-binding of a single haemoglobin of *Aethotaxis mitopteryx* [1992, eng] **B-46390**
Haemotology of the single haemoglobin fish *Aethotaxis mitopteryx* [1992, eng] **B-46391**
Is the growth of polar fish limited by temperature [1991, eng] **B-46530**
Age determination in antarctic fish [1991, eng] **B-46532**
Microstructural analysis of growth patterns in the early life history of antarctic fishes [1991, eng] **B-46533**
Sensory biology of notothenioid fish [1991, eng] **B-46536**

Pisces

PHYSIOLOGY *(cont.)*

Viscosity of body fluids from antarctic notothenioid fish ⌈1991, eng⌋ **B-46537**
Low temperature limits burst swimming performance in antarctic fish ⌈1991, eng⌋ **B-46538**
Adaptations in hemoglobin-free fish ⌈1991, eng⌋ **B-46539**
Heart of the icefish *Chionodraco hamatus* (Lönnberg) ⌈1991, eng⌋ **B-46540**
High lipid content in fish tissues ⌈1991, eng⌋ **B-46541**
Cold adaptation biochemistry and stenothermality in fish ⌈1991, eng⌋ **B-46542**
Polymerization of microtubule proteins from antarctic fish ⌈1991, eng⌋ **B-46543**
Biochemistry of oxygen transport in red-blooded antarctic fish ⌈1991, eng⌋ **B-46544**
Colchicine binding by antarctic fish and bovine tubulins ⌈1992, eng⌋ **B-46607**
Antarctic fishes survive exposure to carbon monoxide ⌈1992, eng⌋ **B-46609**
Structure and function of *P. bernacchii* haemoglobin ⌈1992, eng⌋ **B-46764**
Icefish superoxide dismutase ⌈1990, eng⌋ **B-46799**
Susceptibility of the antarctic fish *Pagothenia borchgrevinki* to MS-222 anaesthesia ⌈1992, eng⌋ **B-46825**
Multiple sex-chromosome system in antarctic ice-fishes ⌈1992, eng⌋ **B-46835**
Antifreeze glycopeptide gene from the cod *Notothenia neglecta* ⌈1990, eng⌋ **B-46910**
Animal diet and trophic structure in the Weddell Sea ⌈1992, eng⌋ **B-46920**
Deficiency of metallothionein in the liver of antarctic icefish ⌈1992, eng⌋ **B-46978**
AFGPs from antarctic fishes ⌈1992, eng⌋ **B-47002**
Biology and physiological ecology of notothenioid fishes ⌈1990, eng⌋ **B-47059**
Lactate dehydrogenase of the icefish heart ⌈1991, eng⌋ **B-47111**
Effects of exposure to diesel fuel oil on fish ⌈1992, eng⌋ **B-47127**
Structure of antarctic fish antifreeze glycoproteins ⌈1992, eng⌋ **B-47215**
Reproduction and larval growth of *Harpagifer antarcticus* Nybelin ⌈1992, eng⌋ **B-47324**
Cardiovascular responses of two antarctic nototheniid fishes ⌈1992, eng⌋ **B-47337**
Function and structure of fish brain and egg tubulins ⌈1992, eng⌋ **B-47373**
RV *Polarstern* expedition program no.24, Antarktis X/3-5 ⌈1992, eng⌋ **D-46057**

POPULATION

Demersal fish surveys at South Georgia, Jan.-Feb. 1990 ⌈1991, eng⌋ **B-45422**
Toothfish, *Dissostichus eleginoides,* at South Georgia ⌈1991, eng⌋ **B-45423**
Declining abundance of *Notothenia rossii marmorata* and *N. gibberifrons* off South Shetland Is. ⌈1991, eng⌋ **B-45424**
Age determination of *Champsocephalus gunnari* Lönnberg, 1905 at South Georgia ⌈1991, eng⌋ **B-45426**
Natural mortality rate of *Champsocephalus gunnari,* South Georgia ⌈1991, eng⌋ **B-45428**
Seasonal and interannual distribution variability of *Electrona carlsbergi* in the Antarctic Convergence area ⌈1991, eng⌋ **B-45430**
Functional division of *Electrona carlsbergi* habitat relative to latitudinal zonation of the southern ocean ⌈1991, eng⌋ **B-45431**
Acoustic surveys of myctophid biomass in the South Atlantic ⌈1991, eng⌋ **B-45434**
Mesopelagic fish of the southern ocean from recent Soviet studies ⌈1991, eng⌋ **B-45435**
Managing depleted fish stocks ⌈1991, eng⌋ **B-45437**
Demersal fish communities of South Georgia ⌈1991, eng⌋ **B-45934**
Ecology of the fish in Weddell Sea ⌈1992, ger⌋ **B-46354**
Contribution of the BIOMASS program to antarctic marine ecosystem research ⌈1991, eng⌋ **B-46535**
Winter ichthyoplankton community off the Antarctic Peninsula ⌈1991, eng⌋ **B-46815**
Ecology of an exploited antarctic fish community ⌈1990, eng⌋ **B-46911**
Abundance and distribution of fish larvae in spring and summer at South Georgia ⌈1992, eng⌋ **B-47322**

TAXONOMY

Studies on the Zoarcidae (Teleostei:Perciformes) of the Southern Hemisphere. V. Two new species from the Weddell Sea, Antarctica ⌈1991, eng⌋ **B-45252**
Additional data on subantarctic ichthyofauna of the French southern islands ⌈1982, fre⌋ **B-45709**
Reports on fishes of the University of Southern California Antarctic Research Program, 1962-1968. 1. A review of the genus *Bathydraco* Günther (family Bathydraconidae) ⌈1985, eng⌋ **B-45710**
Two new species of deepwater anglerfishes in the Ross Sea ⌈1981, rus⌋ **B-45715**
Cytogenetics of notothenioid fishes ⌈1990, ita⌋ **B-46125**
Review of antarctic and subantarctic green notothenias ⌈1992, eng⌋ **B-46406**
Taxonomy of *Gobionotothen angustifrons sandwichensis* ⌈1992, eng⌋ **B-46477**
Anatomy and histology of *Notothenia rossi marmorata* ⌈1992, eng⌋ **B-46478**
Antarctic rock cod genus *Nototheniops* from the Indian Ocean ⌈1992, eng⌋ **B-46479**
Circumcontinental distribution of antarctic plunderfish ⌈1992, eng⌋ **B-46480**
Fossil and modern fish faunas ⌈1991, eng⌋ **B-46534**
Biochemical systematics of Notothenioid fishes from Antarctica ⌈1992, eng⌋ **B-46638**
Introduction to the systematics section ⌈1990, eng⌋ **B-47062**
Myxinidae: Hagfishes ⌈1990, eng⌋ **B-47063**
Petromyzontidae: Lampreys ⌈1990, eng⌋ **B-47064**
Sharks: Lamnidae, Mackerel sharks; Squalidae, Spiny dogfishes ⌈1990, eng⌋ **B-47065**
Rajidae: Skates ⌈1990, eng⌋ **B-47066**
Halosauridae: Halosaurs ⌈1990, eng⌋ **B-47067**
Notocanthidae: Spiny eels ⌈1990, eng⌋ **B-47068**
Synaphobranchidae: Synaphobranchiids ⌈1990, eng⌋ **B-47069**
Microstomatidae: Microstomatids ⌈1990, eng⌋ **B-47070**
Bathylagidae: Deepsea smelts ⌈1990, eng⌋ **B-47071**
Alepocephalidae: Slickheads ⌈1990, eng⌋ **B-47072**
Platytroctidae: Tubeshoulders ⌈1990, eng⌋ **B-47073**
Gonostomatidae: Bristlemouths ⌈1990, eng⌋ **B-47074**
Sternoptychidae: Hatchetfishes ⌈1990, eng⌋ **B-47075**
Stomiidae: Scaly dragonfishes ⌈1990, eng⌋ **B-47076**
Scopelarchidae: Pearleyes ⌈1990, eng⌋ **B-47077**
Notosudidae: Notosudids ⌈1990, eng⌋ **B-47078**

Winter/spring phytoplankton development in the Weddell Sea [1991, ger] **B-45861**
Evolution of the upper water layer in the marginal ice zone, austral spring 1988, Scotia-Weddell Sea [1991, eng] **J-45947**
Oceanographic conditions in the Weddell-Scotia marginal ice zone [1992, eng] **J-46303**

ALBEDO
Optical measurements on the Weddell Sea ice [1990, eng] **F-46007**

BREAKUP
Morphologic properties of the Pacific ice massif [1990, rus] **F-45247**

Sea ice
BREAKUP *(cont.)*
Space radar observation of the dynamics of the ice coast and the drift of icebergs in the Antarctic [1992, eng] **F-46107**
CHEMISTRY
Biological role of DMSP in ice algae [1991, eng] **B-46234**
Nutrients in sea ice and underlying layer of McMurdo Sound [1990, eng] **B-46264**
Ice edge phytoplankton blooms, Weddell-Scotia Seas [1992, eng] **B-46413**
Sampler for nutrients and Chl *a* in sea ice platelet layers [1992, eng] **B-46805**
Polynucleate hydrocarbons in antarctic sea ice [1991, spa] **F-45185**
Winter nutrient status in Weddell Sea ice [1991, eng] **F-45358**
Ecology of colored fast ice in coastal waters off the Great Wall Station [1991, eng] **F-45463**
Isotopic composition of ice samples from the Hells Gate and Backstairs Passage Glacier [1991, eng] **F-45762**
Sea-ice studies on the Winter Weddell Gyre Study, 1989 [1990, eng] **F-46004**
Optical measurements on the Weddell Sea ice [1990, eng] **F-46007**
Radar backscatter measurements during the Winter Weddell Gyre Study [1990, eng] **F-46008**
Isotopic composition of sea ice as a tool for understanding sea ice processes in the polar regions [1992, eng] **F-46394**
Salinity profiles of antarctic sea ice: field data and model results [1992, eng] **F-47131**
Winter Weddell Gyre Study 1989: biochemistry [1990, eng] **J-46003**
Organic compounds in sea water and pack ice in Terra Nova Bay (Antarctica) [1991, eng] **J-46153**
Pesticides in Terra Nova Bay [1991, eng] **J-46163**
CLASSIFICATION
Comparison of radar backscatter from antarctic and arctic sea ice [1992, eng] **F-47199**
CONSTRUCTION
Landing and parking a C5 Galaxy on sea ice: McMurdo Station, Antarctica [1992, eng] **G-47355**
CORES
Distribution of chlorophyll *a* and diatom in the sea ice of the Weddell Sea, Antarctica [1991, eng] **B-45176**
Winter nutrient status in Weddell Sea ice [1991, eng] **F-45358**
Salinity profiles of antarctic sea ice: field data and model results [1992, eng] **F-47131**
DEFORMATION
Ice texture and growth in the Weddell Sea [1991, eng] **F-45352**
Compressive strength of frazil sea ice [1992, eng] **F-46774**
DENSITY
Spatial and temporal variability of ice concentration in the South Pacific Ocean [1990, rus] **F-45248**
Radar backscatter measurements during the Winter Weddell Gyre Study [1990, eng] **F-46008**
DISTRIBUTION
Observation of seabirds in the southern ocean in 1988/89 [1991, eng] **B-45440**
Physiology of polar marine zooplankton [1991, eng] **B-46708**
Increases in penguin population related to sea ice cover changes [1992, eng] **B-46820**
Ocean atmosphere energy exchange over thin pack ice [1991, eng] **F-45349**
Sea ice and oceanic mixed layer model for the southern ocean [1991, eng] **F-45350**
Sea ice model used with an atmospheric GCM [1991, eng] **F-45351**
Rheology and movement of a sea ice floe aggregate [1991, eng] **F-45353**
Comparisons of SSM/I and Landsat imagery for determination of sea ice concentrations [1991, eng] **F-45364**
Kinematics of sea ice and atmospheric conditions in the Antarctic [1991, eng] **F-45456**
Sea ice [1991, eng] **F-45478**
Variations of extent, area, and open water of the polar sea ice covers: 1978-1987 [1991, eng] **F-45982**
Detection of temperature and sea ice extent changes in the Antarctic and southern ocean [1991, eng] **F-45984**
Antarctic sea ice: its development and basic properties [1991, eng] **F-45994**
Interannual variability of monthly southern ocean ice distribution [1992, eng] **F-46256**
MOS-1 multi-sensor data set for sea ice monitoring [1991, eng] **F-46501**
Growth, structure and properties of antarctic sea ice [1991, eng] **F-46654**
Antarctic ice charts 1989-1990 [1992, eng] **F-46776**
Multi-sensor data set and sea ice study [1992, jpn] **F-46904**
Physical and dynamic properties of sea ice in the polar oceans [1991, eng] **F-47180**
MOS-1 data received at Showa Station [1990, jpn] **F-47316**
Sea ice influence on the development of a cyclone in Antarctica [1990, spa] **I-45128**
Antarctic climate manifestations from observations on South Orkney Is. [1990, spa] **I-45131**
Effects of atmospheric processes on sea ice conditions in 1983-1985 [1990, rus] **I-45672**
Atmospheric and ice conditions in the Pacific Ocean, 1985-1986 [1990, rus] **I-45673**
Sensitivity of the Southern Hemisphere circulation to leads in the antarctic pack ice [1991, eng] **I-45808**
Open water and circumpolar trough in the Antarctic [1992, eng] **I-46557**
Climate characteristics [1989, por] **I-46623**
Interaction between antarctic ice extension and Brazilian climate [1989, por] **I-46625**
Pattern of ocean-atmosphere exchange in a Weddell Sea ice core [1992, eng] **I-47254**
Oceanographic conditions in the Weddell-Scotia marginal ice zone [1992, eng] **J-46303**
DRIFTING
Ice drifting properties in the Russkaya Station region [1990, rus] **F-45243**
Sea-ice dynamics in the Weddell Sea in winter [1991, eng] **F-45346**
One-dimensional model for wave-induced ice-floe collisions [1991, eng] **F-45347**
Rheology and movement of a sea ice floe aggregate [1991, eng] **F-45353**
Ice Station Weddell launched in the northwestern Weddell Sea [1992, eng] **F-45606**
Sea ice advection derived from buoy and satellite data [1992, eng] **F-47132**
Air-ice drag coefficient in the Weddell Sea deduced from profile measurements [1992, eng] **F-47297**
Atmospheric and ice conditions in the Pacific Ocean, 1985-1986 [1990, rus] **I-45673**
German Meteorologists Meeting 1992 [1992, ger] **I-46924**
Geostrophic wind and sea ice motion in the Weddell Sea [1992, ger] **I-46926**
Ocean currents in Discovery Bay [1990, spa] **J-46691**
FORECASTING
Interannual variability of monthly southern ocean ice distribution [1992, eng] **F-46256**
Interaction between antarctic ice extension and Brazilian climate [1989, por] **I-46625**
FORMATION

Evidence for basal marine ice in the Filchner-Ronne ice shelf [1992, eng] **F-46739**
Ocean circulation beneath the Ronne ice shelf [1991, eng] **J-45154**
Thermohaline circulation beneath the Filchner-Ronne ice shelves [1991, eng] **J-45226**

ABLATION
Melt rates and mass balances, bottoms of Filchner/Ronne ice Shelves [1990, eng] **F-45922**

ACCUMULATION
Accumulation on the Filchner and Ronne Ice Shelves [1990, ger] **F-47310**

AGE DETERMINATION
Hells Gate and Backstairs Passage ice shelves, Victoria Land, Antarctica [1988, eng] **E-45702**

BREAKUP
Breakup of Wordie Ice Shelf, Antarctica [1991, eng] **F-46657**

CALVING
Giant icebergs in the Weddell Sea [1990, rus] **F-45249**
NARE 1984-1985 glaciological research [1986, eng] **F-45501**
Stratigraphy and isotope analysis of an antarctic ice shelf [1991, eng] **F-45543**
Breakup of Wordie Ice Shelf, Antarctica [1991, eng] **F-46657**

CHEMISTRY
520 year temperature record of a 100 m core from the Ronne Ice Shelf, Antarctica (extended abstract) [1990, eng] **F-45518**
Glaciology of Filchner-Ronne Ice Shelf, 1989/90 [1990, eng] **F-45532**
Stable isotopes in antarctic ice: glaciological implications [1991, eng] **F-45760**
Isotopic composition of ice samples from the Hells Gate and Backstairs Passage Glacier [1991, eng] **F-45762**
Accumulation on the Filchner and Ronne Ice Shelves [1990, ger] **F-47310**
Stable isotope results, Wilkes Land Oceanographic Expedition, 1985 [1990, eng] **J-46001**

DEFORMATION
Measurement, analysis, and modeling of deformation of the shelf flow, Byrd Glacier [1990, eng] **F-47115**

DESTRUCTION
Antarctic global warming [1992, eng] **F-45686**
DRILLING
Hot water drilling in ice shelf/ocean boundary studies [1990, eng] **F-45534**
Glaciological and oceanographic studies on the Fimbul Ice Shelf, 1989-1990 [1990, eng] **F-45536**
ELECTRICAL PROPERTIES
Glaciology of Filchner-Ronne Ice Shelf, 1989/90 [1990, eng] **F-45532**
Analysis of meteoric and marine ice of the Filchner-Ronne Ice Shelf [1990, eng] **F-45533**
FLOW
Flowline on Ronne Ice Shelf [1986, eng] **F-45493**
Glaciological geodesy on Filchner Ice Shelf 1983-86 [1986, eng] **F-45495**
NARE 1984-1985 glaciological research [1986, eng] **F-45501**
Ice rumples between Korff and Henry ice rises [1986, eng] **F-45506**
Finite element modelling of the Filchner-Ronne Ice Shelf [1986, eng] **F-45507**
On the flow within the transition zone between ice sheet and ice shelf [1986, eng] **F-45508**
Glaciological fieldwork on Ronne Ice Shelf, 1985-1988 [1990, eng] **F-45515**
Ice velocity, flow line, and deformation determination from GPS and Transit at Filchner Ronne Ice Shelf [1990, eng] **F-45517**
British Antarctic Survey on Ronne Ice Shelf, 1988/89 [1990, eng] **F-45520**
Glacial geodetic investigations on Filchner-Ronne Ice Shelf 1989/90 [1990, eng] **F-45522**
Glaciological data: geodetic measurements [1990, eng] **F-45527**
One-dimensional model of ice shelf-ocean interaction [1990, eng] **F-45535**
Ice flow and surficial variations of Larsen Ice Shelf and Nansen Ice Sheet [1991, eng] **F-45765**
Gravity currents beneath ice shelves [1991, eng] **F-46658**
Measurement, analysis, and modeling of deformation of the shelf flow, Byrd Glacier [1990, eng] **F-47115**
Oceanographic research during NARE-84/85 [1986, eng] **J-45509**
GRAVIMETRIC EXPLORATION
Geophysical study in the northern sector of the Antarctic Peninsula and the Larsen Ice Shelf [1990, spa] **F-45122**
MASS BALANCE
Melt rates and mass balances, bottoms of Filchner/Ronne ice Shelves [1990, eng] **F-45922**
Breakup of Wordie Ice Shelf, Antarctica [1991, eng] **F-46657**
One-dimensional model of ice shelf-ocean interaction [1991, eng] **J-45373**
MECHANICAL PROPERTIES
Melt rates and mass balances, bottoms of Filchner/Ronne ice Shelves [1990, eng] **F-45922**
MORPHOLOGY
Glaciological fieldwork on Ronne Ice Shelf, 1985-1988 [1990, eng] **F-45515**
POLLUTION
Fuel spill clean-up in the Antarctic [1991, eng] **G-45954**
SEISMIC EXPLORATION
Effectiveness of different shooting techniques in antarctic firn [1991, eng] **F-46105**
Interpretation of seismic data collected on floating ice [1992, eng] **F-47348**
STRUCTURE

Isotopic composition of sea ice as a tool for understanding sea ice processes in the polar regions [1992, eng] **F-46394**
Nitrate content in the surface snow along the route of the 1990 International Trans-Antarctic Expedition [1992, eng] **F-46400**
Chemical composition of falling snow at Dumont d'Urville, Antarctica [1992, eng] **F-46429**
Variations in heavy metals concentrations in antarctic snows from 1940 to 1980 [1992, eng] **F-46432**
Spatial and temporal variations of methanesulfonic acid and non-sea salt sulfate in antarctic ice [1992, eng] **F-46434**
Chemistry of Nelson I. ice cover [1991, chi] **F-46447**
Determination of hydrogen peroxide in snow [1992, eng] **F-46558**
Relationship between mean delta 0-18 values of surface snow and air temperature [1992, eng] **F-46559**
Electrothermal atomic absorption spectrometric analysis for heavy metals in snow [1992, eng] **F-46577**
Deciphering recent structures and Holocene evolution of the marginal East Antarctic ice cover [1991, eng] **F-46649**
Seasonal snow chemistry at the South Pole and Summit, Greenland [1992, eng] **F-46690**
Study of methanesulfonic acid in ice cores [1991, eng] **F-46867**
Seasonal input of heavy metals to antarctic snow [1992, eng] **F-47248**
Polar climate iteration? [1991, eng] **I-46043**
Comments on the origin of dust in East Antarctica for present and ice age conditions [1992, eng] **I-46430**
Free tropospheric reservoir of natural sulfate [1992, eng] **I-46435**
Origin of July antarctic precipitation and its influence on deuterium content: a GCM analysis [1992, eng] **I-46581**
Precipitation nitrogen at Signy I. and Cape Bird [1992, eng] **I-46834**
Aerosol and general atmospheric circulation models [1992, eng] **I-47250**
Antarctica Project. Environmental impact: chemical methodologies [1991, eng] **J-46144**
Air-sea exchange and snow microcomponents [1991, eng] **J-46156**

COMPACTION
Penetration of solar radiation into the artificially compacted snow of runways [1990, rus] **F-45646**
Remote radiometric determination of characteristics of artificially compacted snow covers [1991, rus] **F-46493**

CONSTRUCTION
Improved construction of high-strength antarctic aerodromes [1991, eng] **G-45965**

CRYSTALS
Structure of polycrystalline initial ice crystals [1992, eng] **F-46393**
Z-R relation for graupels and aggregates at Showa Station [1992, eng] **F-46556**

DENSITY
Glaciological data [1990, eng] **F-45526**

Snow accumulation and melting at the Great Wall Station [1991, chi] **F-46448**
Remote radiometric determination of characteristics of artificially compacted snow covers [1991, rus] **F-46493**
Snow properties from passive microwave observations of Antarctica [1991, eng] **F-46503**
Microwave signature measurements of antarctic firn [1991, eng] **F-46504**
Thermal properties of snow/firn on the Law Dome ice cap [1991, eng] **F-46851**

DEPTH
Snow properties from passive microwave observations of Antarctica [1991, eng] **F-46503**

DISTRIBUTION
Glaciological zonation and seasonal snow resources throughout the world [1991, rus] **F-46990**
Macroscale characteristics of snow cover distribution throughout the world [1991, rus] **F-46991**
Climate-ice interactions [1991, eng] **I-45472**

DRIFTING
Estimating method of the precipitation in snow storms [1991, jpn] **F-45087**
Similitude requirements of snowdrift modelling for antarctic environment [1991, eng] **F-46104**
Design of antarctic buildings for wind and snow problems [1991, eng] **G-45970**
Settlement and deformation of buildings at Asuka Station [1991, eng] **G-45971**
Wind loads on and snowdrift around antarctic buildings [1990, eng] **G-46140**
Study on prediction of snowdrift around buildings in Antarctica [1990, eng] **G-46142**
Wind tunnel study of wind loads on and snowdrift around the buildings for antarctic use [1990, eng] **G-46672**
Wind tunnel test of wind loads on various shapes of elevated buildings for antarctic use [1990, eng] **G-46673**

ELECTRICAL PROPERTIES
Snow-stratification investigation on an antarctic ice stream with an X-band radar system [1991, eng] **F-45542**
Soviet glaciological studies in 1990 [1991, rus] **F-47013**

INSTRUMENTS
Snow wetness and SSM/I brightness temperatures for the Weddell Sea [1990, eng] **F-45064**
Snow-stratification investigation on an antarctic ice stream with an X-band radar system [1991, eng] **F-45542**
Variations in heavy metals concentrations in antarctic snows from 1940 to 1980 [1992, eng] **F-46432**
Snowfall and snow clouds at Showa Station [1992, eng] **F-46555**

MAPS AND CHARTS
Antarctica from NOAA satellites. Clouds, ice and snow [1992, eng] **I-46595**

MECHANICAL PROPERTIES
Antarctic airfields and runways [1991, eng] **G-45964**
Improved construction of high-strength antarctic aerodromes [1991, eng] **G-45965**

MODELS
MSSL Science Plan [1990, eng] **F-45531**
Similitude requirements of snowdrift modelling for antarctic environment [1991, eng] **F-46104**
Snow properties from passive microwave observations of Antarctica [1991, eng] **F-46503**

PHYSICAL PROPERTIES
Remote radiometric determination of characteristics of artificially compacted snow covers [1991, rus] **F-46493**
Snow properties from passive microwave observations of Antarctica [1991, eng] **F-46503**
Z-R relation for graupels and aggregates at Showa Station [1992, eng] **F-46556**

POLLUTION
Radionuclide content in samples from the Terra Nova Bay Station [1991, eng] **E-46157**
Ion chromatography in snow and ice analyses [1991, eng] **F-46148**
Variations in heavy metals concentrations in antarctic snows from 1940 to 1980 [1992, eng] **F-46432**
Chemistry of Nelson I. ice cover [1991, chi] **F-46447**
Seasonal input of heavy metals to antarctic snow [1992, eng] **F-47248**
Ultra-trace analysis of heavy metals in ice and snow from the Antarctic and Greenland [1992, eng] **I-46064**
Radioactive precipitation levels on King George I. [1989, por] **I-46622**
Heavy metals in snow and sea water at Terra Nova Bay Station [1991, eng] **J-46147**
Air-sea exchange and snow microcomponents [1991, eng] **J-46156**

RADIATION
Snow wetness and SSM/I brightness temperatures for the Weddell Sea [1990, eng] **F-45064**
Remote radiometric determination of characteristics of artificially compacted snow covers [1991, rus] **F-46493**

STRATIGRAPHY
Snow stratigraphy and accumulation at Browning Pass [1991, eng] **F-45763**
Study on snow profiles and surface characteristics along 6000 km trans-antarctic route (I) [1992, eng] **F-46392**
Chemistry of Nelson I. ice cover [1991, chi] **F-46447**

STRUCTURE
Study on snow profiles and surface characteristics along 6000 km trans-antarctic route (I) [1992, eng] **F-46392**

SURFACE FEATURES
MSSL Science Plan [1990, eng] **F-45531**

GEOGRAPHIC INDEX

Aboa Station
- FINNARP 88 construction activities [1991, eng] G-45973

Adélie Coast
- Modern radiolaria of the continental shelf of East Antarctica [1992, eng] B-46887
- Metabolic and hormonal adaptations of Emperor and King penguins during molt while fasting [1992, eng] B-47265
- Foraging behavior of emperor penguins [1992, eng] B-47336
- Variations in heavy metals concentrations in antarctic snows from 1940 to 1980 [1992, eng] F-46432
- Environmental protection at the French airstrip in Adélie Land [1991, eng] G-45955
- Winds in the coastal area of Adélie Land [1990, eng] I-46332

Admiralty Bay
- Range of variation in respiration in two antarctic amphipods from Admiralty Bay [1991, eng] B-45397
- Seasonal changes in respiration and biomass of antarctic krill from Admiralty Bay [1991, eng] B-45398
- Respiratory ETS-activity of microorganisms from Admiralty Bay [1991, eng] B-45602
- Demography and foraging behavior of Pygoscelis penguins [1990, eng] B-46282
- Biometric observations on a krill sample [1990, spa] B-46694
- Cs-137 concentrations in soil profiles from Admiralty Bay and Canto Point [1990, spa] E-46699
- Chlorophyll *a* and primary productivity in Admiralty Bay [1990, eng] J-46583

Alasheyev Bight
- Radar observation of icebergs in Alasheyev Bight [1990, rus] F-45240

AlaskaKotzebue Sound
- Physical and dynamic properties of sea ice in the polar oceans [1991, eng] F-47180
- Glacier, river and sea ice blister observations [1992, eng] F-47213
- Glacier, river and sea ice blister observations [1992, eng] F-47213
- Glacier, river and sea ice blister observations [1992, eng] F-47213

Alexander Island
- Mapping British Antarctic Territory with cameras and satellite imagery [1992, eng] C-47369
- Eustatic sea level changes in a fore-arc basin at Alexander Island [1991, eng] E-46612

Allan Hills
- Triassic osmundaceous ferns from the Allan Hills [1990, eng] E-45827
- Late Triassic flora from the Allan Hills [1990, eng] E-45828
- Permian and Triassic fossil plants in the Allan Hills [1990, eng] E-45829
- Cathodoluminescence of chondrules and chondrites [1992, eng] E-47209
- Ice movement and mass balance at the Allan Hills Icefield [1990, eng] F-45920
- Ablation rates of the ice fields near Allan Hills [1991, eng] F-46173

Amsterdam Island
- Additional data on subantarctic ichthyofauna of the French southern islands [1982, fre] B-45709

Amundsen-Scott Station
- Tunguska event relics in antarctic snow and the cosmic iridium rate [1990, eng] F-45924
- Spatial and temporal characteristics of the Little Ice Age: the antarctic ice core record [1991, eng] F-46041
- Volcanic ash transport to the Greenland and antarctic ice sheets [1992, eng] F-46438
- Seasonal snow chemistry at the South Pole and Summit, Greenland [1992, eng] F-46690
- Life in Antarctica [1990, eng] H-45271
- Social and behavioral research at antarctic stations [1990, eng] H-45272
- Decreasing stress through the introduction of microenvironments [1990, eng] H-45299
- Balloon observations of stratospheric electricity over the South Pole [1991, eng] I-45228
- Ozone level trends from moss specimens [1990, eng] I-45603
- Wind and temperature in the South Pole mesosphere [1992, eng] I-45751
- Mesosphere 12 h wave over the South Pole [1992, eng] I-45753
- Cloud radiative effects at the South Pole during winter [1991, eng] I-45986
- Polar climate iteration? [1991, eng] I-46043
- Infrared atmospheric absorption and emission measurements [1990, eng] I-46324
- Study of polar stratospheric clouds at the South Pole [1990, eng] I-46325
- Global warming problem [1990, eng] I-46326
- Nitrous oxide and halocarbon measurements [1990, eng] I-46328
- Extension of antarctic ozone hole to lower latitudes in the South-American region [1991, eng] I-46719
- Stratospheric clouds at South Pole, winter 1988 [1989, eng] I-46790
- Parameters which influence the air content in polar ice [1992, eng] I-47047
- Ozone depletion in Antarctica in 1991 [1992, eng] I-47054
- Lidar observations of stratospheric clouds at South Pole [1992, eng] I-47145
- Stratospheric clouds at South Pole during 1988 [1992, eng] I-47146
- 1000 years of explosive volcanism recorded at the South Pole [1992, eng] I-47247
- Aerosol and general atmospheric circulation models [1992, eng] I-47250
- Midtropospheric flow patterns for the South Pole [1992, eng] I-47252
- High latitude pulsating aurorae revisited [1992, eng] K-45752
- Cosmic microwave background radiation at 3.8GHz [1991, eng] K-46077
- South Pole Air Shower Experiment [1990, eng] K-46508
- Helioseismology from South Pole [1990, eng] K-46509
- Operation of an atmospheric Cherenkov telescope at the South Pole [1990, eng] K-46510
- Azimuthal variation of stellar magnitudes at the South Pole [1990, eng] K-46511
- Unusual cosmic ray spike [1990, eng] K-46512
- South Pole mesospheric and lower-thermospheric dynamics [1990, eng] K-46513
- Geometrical factors affecting the frequency dependence of auroral absorption [1990, eng] K-46514
- Magnetic pulsations in the polar cap [1990, eng] K-46515
- Ultraviolet radiation in the stratosphere [1990, eng] K-46516
- Dynamics of the conjugate post-noon regions during an auroral enhancement [1992, eng] K-46674
- Anisotropy measurements of the Cosmic Background Radiation at 3 mm wavelength and an angular scale of 30 arcminutes [1990, eng] K-47117

Amundsen Sea
- Comparisons of SSM/I and Landsat imagery for determination of sea ice concentrations [1991, eng] F-45364

Andvord Bay
- Biogenic sedimentation and paleoproductivity in Andvord Bay [1992, eng] E-46888

Antarctic Peninsula
- Review of *Pariphimedia* and redescription of the two antarctic species [1991, eng] B-45094
- Cold-stable microtubules from antarctic fish [1991, eng] B-45627
- Diet, feeding behavior, and morphology of an antarctic echinoderm [1991, eng] B-46101
- Low temperature adaptation in antarctic teleosts [1990, ita] B-46127
- Ageing studies on the early life stages of antarctic fishes [1990, eng] B-46279
- Physiology and ultrastructure of the antarctic green alga *Prasiola crispa* ssp. *antarctica* subjected to osmotic stress and desiccation [1992, ger] B-46355
- Migration of the *Sterna paradisaea* over the Antarctic Peninsula [1992, eng] B-46362
- Forces shaping algal biomass development [1992, eng] B-46416
- Polymerization of microtubule proteins from antarctic fish [1991, eng] B-46543

Antarctic Peninsula *(cont.)*
Assessment of the krill spawning stock off the Antarctic Peninsula [1992, eng] **B-46645**
EIA for salvaging the oil from the *Bahia Paraiso* [1992, eng] **B-46762**
Caloplaca flora of the western antarctic region [1992, eng] **B-46803**
Lichen genus *Stereocaulon* in Antarctica and South Georgia [1991, eng] **B-46813**
Winter ichthyoplankton community off the Antarctic Peninsula [1991, eng] **B-46815**
Ostracods of the epipelagic zone off the Antarctic Peninsula [1992, ger] **B-46857**
Sightings of *Eubalaena australis* in Chilean waters, 1983-1989 [1992, spa] **B-46936**
Dominance of microflagellates over diatoms [1992, eng] **B-46979**
Larval development of antarctic euphausiids [1992, eng] **B-47046**
Doppler positioning on the Antarctic Peninsula [1990, spa] **C-45124**
Spanish-Argentine antarctic geodynamic GPS network project [1990, eng] **C-45145**
Magnetic anomalies over the James Ross Island and surrounding areas [1992, spa] **C-47285**
High resolution seismic record of antarctic glacial history [1991, eng] **E-45321**
Volcanic rocks of the Antarctic Peninsula, the South Shetlands and South America [1991, eng] **E-45326**
Late Holocene tephrochronology of the northern Antarctic Peninsula [1991, eng] **E-45488**
Antarctic fjord sedimentation [1990, eng] **E-45906**
Active margin processes along the Antarctic Peninsula [1992, eng] **E-46067**
Tectonic development of the Scotia arc region [1991, eng] **E-46340**
Neogene interaction of tectonic and glacial processes [1991, eng] **E-46610**
Petrographic evolution of an active margin sedimentary sequence [1991, eng] **E-46722**
Paleoenvironments of the Nordenskjöld Formation [1991, eng] **E-46723**
Mineralogy of surface sediments in northwest waters off the Antarctic Peninsula [1991, eng] **E-46855**
USAP 1991 *Polar Duke* cruise and equipment status report [1991, eng] **E-47204**
Structural features of northeastern Antarctic Peninsula and of James Ross Island [1992, spa] **E-47288**
Proposed nomenclature for sedimentary basins off the Antarctic Peninsula [1992, eng] **E-47331**
Geophysical study in the northern sector of the Antarctic Peninsula and the Larsen Ice Shelf [1990, spa] **F-45122**
Bromo- and bromochloromethanes in antarctic atmospheres and waters [1992, eng] **I-46636**
Ratio of MSA to non-sea-salt sulphate in Antarctic Peninsula ice cores [1992, eng] **I -47243**
NO2 total column evolution over the Antarctic Peninsula [1992, eng] **I-47266**
Variability of local upwelling off the Antarctic Peninsula, 1986-1990 [1992, eng] **J-46646**
Accurate gravity air-link between South America and the Antarctic Peninsula [1990, eng] **L-45116**
Comparison between the total geomagnetic field reference values and those measured in the Drake Passage [1990, spa] **L-45123**
Crustal structure of the southern Weddell Sea [1992, chi] **L-46893**

Anvers Island
Macroalgae vertical distribution near Anvers I. [1990, eng] **B-46271**
Ecology of Kelp Gulls *(Larus dominicanus)* on Anvers I. [1989, eng] **B-47121**

Arctowski Station
Developmental biology of antarctic birds [1991, eng] **B-45318**
Polish geodetic and cartographic studies in the arctic and antarctic regions [1990, eng] **C-45150**
Geodetic works performed during the 12th summer expedition to the H. Arctowski Polish Antarctic Station [1989, pol] **C-45267**
Oil in the soil and effect of sewage on the water near Arctowski Station [1991, eng] **G-45399**

Ardley Island
Rock pigeon and blue petrel in the South Shetland Is. [1991, eng] **B-45090**
Eco-ethological variables in a rookery on Ardley I. [1989, spa] **B-47158**
Pygoscelis papua adaptation to stress on Ardley I. [1989, spa] **B-47159**
Summer oxygen-minimum layer in waters adjacent to the South Shetland Is. and Ardley I. [1991, eng] **J-46854**

Arena Valley
Cosmogenic neon in ultramafic nodules from Asia and in quartzite from Antarctica [1991, eng] **E-45105**

Arthur Harbor
EIA for salvaging the oil from the *Bahia Paraiso* [1992, eng] **B-46762**
Phytoplankton and oceanographic parameters variability in Arthur Harbor [1990, eng] **J-46275**

Artigas Station
Actividad científica 1987/88, Vol.3 [1989, spa] **A-47150**
Egg-laying and fertility in *Pygoscelis papua* [1989, spa] **B-47160**
Psychological tests of personnel at Artigas Station [1989, spa] **H-47162**
Meteorological investigations in Antarctica [1989, spa] **I-47151**
Sea level observations at Artigas Station, King George I. [1990, spa] **J-45121**
Tidal measurements and harmonic analysis at Artigas Station [1991, eng] **J-45331**

Asuka Station
Activities of the 4th wintering party at Asuka Station by the 31st Japanese Antarctic Research Expedition in 1990 [1992, jpn] **A-46752**
Newly designed wind generator for Antarctica [1991, eng] **G-45957**
Settlement and deformation of buildings at Asuka Station [1991, eng] **G-45971**
Cloud-radiative forcing over the snow-covered surface around Asuka Station, Antarctica [1992, eng] **I-46554**
Meteorological data from Asuka Station, 1990 [1992, eng] **I-46594**
Meteorological data at Showa and Asuka stations, 1990 [1992, eng] **I-46900**
Upper atmosphere physics data, Syowa and Asuka Stations, 1989 [1992, eng] **K-46181**
Characteristics of 30-MHz interference noises observed by riometers [1992, jpn] **K-47339**
Upper atmosphere physics at Asuka Station in 1989 [1992, jpn] **K-47346**

Auckland Islands
Asterad tree interacting with a myrtaceous on the Auckland Is. [1991, eng] **B-46254**

Backstairs Passage Glacier
Hells Gate and Backstairs Passage ice shelves, Victoria Land, Antarctica [1988, eng] **E-45702**
Isotopic composition of ice samples from the Hells Gate and Backstairs Passage Glacier [1991, eng] **F-45762**

Bailey Peninsula
Photosynthetic production of *Usnea sphacelata* [1991, eng] **B-45195**
Lichen polyhydric alcohol content and environmental pollution [1992, eng] **B-46365**

Balchen Mountain
Dissakisite-(Ce), a new member of the epidote group and the Mg analogue of allanite-(Ce), from Antarctica [1991, eng] **E-46576**

Barton Peninsula
Littoral water properties and algal growth at the Barton Peninsula [1991, kor] **B-46080**
Volcano-plutonic rocks of the Barton and Weaver Peninsulas [1991, eng] **E-45325**
Epithermal alteration and mineralization on Barton Peninsula [1991, eng] **E-45327**
Gravity model of geological structure of the Barton Peninsula [1991, kor] **E-46083**

Beardmore Glacier
Pliocene stand of *Nothofagus* near South Pole [1991, eng] **E-45223**
Paleoenvironment of clastics from Beardmore Glacier [1991, eng] **E-46174**
Polar forest from the Permian of Antarctica [1992, eng] **E-47005**

Beaver Lake
Cenozoic history in northern Prince Charles Mountains [1991, eng] **E-46482**

Belgrano II Station
Polynucleate hydrocarbons in antarctic sea ice [1991, spa] **F-45185**
Diffusion difference between warm and cold waters [1991, spa] **J-45187**
Environmental conditions for astronomical observations at the Belgrano II Station [1990, spa] **K-45132**
Upper atmosphere data recording at Belgrano II Station [1990, spa] **K-45136**
Auroral ruptures observed at Belgrano II Station [1990, spa] **K-45139**
Magnetospheric response to the passages across the heliographic current [1990, eng] **K-45142**

Bellingshausen Sea
- Microplanktonic distribution west of the Antarctic Peninsula [1991, eng] B-46814
- Submarine canyons in the Bellingshausen Sea and the Riiser-Larsen area [1991, eng] E-46201
- Morphologic properties of the Pacific ice massif [1990, rus] F-45247
- Increased UV radiation due to ozone depletion reduces phytoplankton productivity [1992, eng] I-45604
- Relationship between polynucleate hydrocarbon concentration profiles and submarine subsoil [1991, spa] J-45186
- Bayesian model selection and parameter estimation [1990, eng] J-46396

Bernardo O'Higgins Station
- German/Chilean cooperative ERS-VLBI antarctic ground station [1991, eng] G-45962
- Antarctic aerosols [1992, eng] I-46931

Bird, Cape
- Precipitation nitrogen at Signy I. and Cape Bird [1992, eng] I-46834

Bird Island
- Diving patterns and performance of the antarctic blue-eyed shag [1991, eng] B-45095
- Scientific investigations of the National Marine Mammal Laboratory, 1990 [1992, eng] B-45555
- Winter diving in Gentoo penguins [1992, eng] B-46671
- Spatial dispersion patterns of antarctic seabirds [1988, eng] B-46912
- Analysis of the milk fat of the fur seal *Arctocephalus gazella* [1992, eng] B-46918
- Annual variations in breeding Gentoo and Macaroni Penguins [1992, eng] B-46942
- Fostering behaviour and milk stealing in antarctic fur seals [1992, eng] B-46975
- Gentoo Penguin diving pattern and performance in relation to foraging ecology [1992, eng] B-47123
- Distributions and predator-prey interactions near Bird Island [1992, eng] B-47290
- Maximum dive depths attained by the petrel *Pelecanoides georgicus* at Bird I. [1992, eng] B-47326

Bonney, Lake
- Photosynthesis-irradiance relationships in phytoplankton [1992, eng] B-46184
- Phytoplankton photoadaptation in ice-covered lakes [1990, eng] B-46312
- Phytoplankton photosynthesis-irradiance relationships [1990, eng] B-46313
- Lake Bonney phytoplankton's photochemical apparatus [1990, eng] B-46314
- Effects of nutrient enrichment on Lake Bonney's primary productivity [1990, eng] B-46315
- Temperature and conductivity finestructure from Lake Bonney [1990, eng] B-46316

Borchgrevink Coast
- Geology and petrology of the Wilson Terrane on Borchgrevink Coast [1991, eng] E-45770
- Ordovician uplift pattern on the Borchgrevink Coast [1991, eng] E-45779

Borge Bay
- Heart ventricle of the haemoglobinless icefish *Chaenocephalus aceratus* [1991, eng] B-45086

Brabant Island
- Colchicine binding by antarctic fish and bovine tubulins [1992, eng] B-46607

Bransfield Strait
- Structure and function of bacterial populations in the Bransfield Strait [1991, eng] B-45315
- Planktonic organisms in Bransfield Strait during summer 1989-1990 [1991, eng] B-45316
- Stomach structure of antarctic amphipods [1991, eng] B-45400
- Spring bloom dynamics [1990, eng] B-46009
- Body size variation of *Metridia gerlachei* in Bransfield Strait, 1986-1987 [1990, eng] B-46027
- Macrobenthic community of Maxwell Bay [1991, kor] B-46081
- Phytoplanktonic nitrogen assimilation near South Georgia and in Bransfield Strait [1991, eng] B-46227
- Relative abundance of zooplankton in the Bransfield Strait, 1987-1988 [1989, spa] B-46715
- Microplanktonic distribution west of the Antarctic Peninsula [1991, eng] B-46814
- *Thysanoessa macrura* (Euphausiacea) in Bransfield Strait region [1992, eng] B-46921
- Magnetic anomalies over the James Ross Island and surrounding areas [1992, spa] C-47285
- Active margin processes along the Antarctic Peninsula [1992, eng] E-46067
- Sediment geochronologies for high-latitude continental shelf deposits [1992, eng] E-46728
- Recent volcanism across the Bransfield Strait [1992, spa] E-46929
- Evolution of the South Shetland margin and the Bransfield Strait [1990, spa] E-46944
- Constraints on mixing and melting models of volcanism, Bransfield Strait [1992, eng] E-46989
- Clay minerals in surface sediments in Bransfield Strait [1992, eng] E-47362
- Water mass interaction, mixing and primary productivity in the Bransfield Strait [1991, eng] J-45319
- Vertical distribution of chlorophyll *a*, Bransfield Strait, Nov. 1986 [1991, eng] J-45396
- Water mass characteristics in Bransfield Strait [1987, eng] J-45730
- Lagrangian drifters in the Gerlache and Bransfield Straits [1990, eng] J-46012
- Biogenic silica and organic carbon in antarctic marine environments [1991, eng] J-46243
- Biosiliceous particle flux in the southern ocean [1991, eng] J-46244
- South Atlantic scavenging and particle flux variations [1991, eng] J-46246
- Stable isotope ratios of POC from the South Atlantic sector [1991, eng] J-46248
- Primary production and export flux in the South Atlantic [1991, eng] J-46249
- Chlorophyll *a* distribution in Bransfield Strait, 1987-1988 [1989, spa] J-46714
- Circulation and temperature models for effects on krill larvae development and distribution [1989, eng] J-47114
- Upper ocean thermal structure off the northwestern Antarctic Peninsula [1992, eng] J-47144
- Magnetic anomalies in Bransfield Strait [1991, kor] L-46084
- Seismic profiles of the South Shetlands and Bransfield Strait [1990, spa] L-46945

Breid Bay
- Three species of amphipod crustaceans from Breid and Lützow-Holm Bays [1992, eng] B-47031
- Archaeogastropods from Breid Bay [1992, eng] B-47040
- Submarine canyons in the Bellingshausen Sea and the Riiser-Larsen area [1991, eng] E-46201
- Vertical fluxes of organic materials in Breid Bay [1992, eng] J-46298

Browning Pass
- Snow stratigraphy and accumulation at Browning Pass [1991, eng] F-45763

Bunger Hills
- Raised beaches of the Bunger Hills, Antarctica [1991, eng] E-46489
- Petrogenesis of plutonic rocks in the Bunger Hills [1992, eng] E-47125
- Interpreting sea ice and bedrock of Antarctica [1991, rus] F-45377
- Late Quaternary glaciation and deglaciation of the Bunger Hills, Antarctica [1992, eng] F-47327

Byrd Glacier
- Measurement, analysis, and modeling of deformation of the shelf flow, Byrd Glacier [1990, eng] F-47115

Byrd Station
- Study of ice borehole closure by finite element method [1992, eng] F-47356
- Comments on the origin of dust in East Antarctica for present and ice age conditions [1992, eng] I-46430
- Carbon isotopes in atmospheric CO2 frozen in an ice core [1992, eng] I-46459

Campbell Glacier
- Granulite facies rocks of the Wilson Terrane [1991, eng] E-45775

Campbell Island
- Breeding biology of the yellow-eyed penguin on Campbell Island [1992, eng] B-47291

Canto Point
- Vegetation cover of Canto Point, Greenwich I. [1990, spa] B-46696
- Fresh water pond at Canto Point, Greenwich I. [1990, spa] B-46697
- Geodetic survey at Canto Point in the Second Ecuadorian Expedition [1990, spa] C-46700
- Cs-137 concentrations in soil profiles from Admiralty Bay and Canto Point [1990, spa] E-46699
- Site of the Ecuadorian antarctic station [1990, spa] G-46703

Casey Station
- Soil and lichen microbiology at Casey Station [1992, eng] **B-46826**
- Quarrying in Antarctica: Australian territory's rebuilding programme [1992, eng] **G-46094**

Charlie, Dome
- Last deglaciation in Antarctica [1991, eng] **F-46663**

Churchill Mountains
- *Marocella:* antarctic specimens of an enigmatic Cambrian animal [1992, eng] **E-47129**

Clarence Island
- Bathymetry around Elephant and Clarence Islands [1990, eng] **E-45910**

Comandante Ferraz Station
- INPE in Antarctica: in celebration of INPE's 30 years [1992, eng] **A-46713**
- Developmental biology of antarctic birds [1991, eng] **B-45318**
- Trace elements in atmospheric aerosols from the Antarctic Peninsula [1990, eng] **I-45134**
- Ozone measurements on Antarctic Peninsula [1989, por] **I-46618**
- Antarctic ozone hole: recent results [1989, por] **I-46619**
- Radon as a natural atmospheric tracer on the Antarctic Peninsula [1989, por] **I-46620**
- Elementary composition and sources of aerosols in the atmosphere [1989, por] **I-46621**
- Chemical composition of rain water at Comandante Ferraz Station [1989, por] **I-46626**
- Atmospheric aerosols from the Antarctic Peninsula [1992, eng] **I-47246**
- Sidereal time CNI variations at Comandante Ferraz Station [1990, eng] **K-45138**
- Geomagnetic and geoelectric pulsations at Comandante Ferraz Station [1989, por] **K-46616**
- Ionospheric research in Antarctica: cosmic noise measurements [1989, por] **K-46617**
- Studies of cosmic ray sources at high latitudes [1989, por] **K-46628**

Commonwealth Bay
- Krill migration in Commonwealth Bay [1990, eng] **B-45263**

Coronation Island
- Distribution of krill aggregations around Coronation I. in 1989/90 [1991, eng] **B-45413**

Croker Passage
- Predatory feeding behavior of an antarctic marine copepod [1991, eng] **B-46709**

Crozet Islands
- "To relieve those Shipwrecked": the Royal Navy and the Iles Crozet, 1876-77 [1992, eng] **A-47173**
- Acoustic signals in the Wandering Albatross [1991, eng] **B-45159**
- King Penguin breeding biology and population dynamics [1992, eng] **B-46309**
- King Penguin diet at Possession Island [1992, eng] **B-46310**
- Morphometric variability in the Kerguelen cormorant and the gentoo penguin [1992, eng] **B-47263**
- Metabolic and hormonal adaptations of Emperor and King penguins during molt while fasting [1992, eng] **B-47265**

Dakshin Gangotri Station
- Atmospheric turbulence in the surface layer [1991, eng] **I-45881**

Dallmann Bay
- Icefish superoxide dismutase [1990, eng] **B-46799**

David Island
- Petrogenesis of plutonic rocks in the Bunger Hills [1992, eng] **E-47125**

Davis Station
- Functional esthetics to enhance well-being in isolated and confined settings [1990, eng] **H-45297**
- Investigations of required sampling regimes for environmental parameters [1991, eng] **I-45443**

Deception Island
- Seismoacoustic studies of the Deception I. caldera [1990, eng] **E-45149**
- Active volcanism on Deception I. [1988, eng] **E-45701**
- Geochemistry of an ensialic marginal basin volcano on Deception I. [1992, eng] **E-46575**
- Seismic activity on Deception Island [1990, spa] **L-45119**
- Magnetic anomalies on Deception I. and their integration in the study of Bransfield Strait [1990, spa] **L-45120**
- Magnetic anomalies in southern Bransfield Strait [1990, spa] **L-46943**
- Seismic profiles of the South Shetlands and Bransfield Strait [1990, spa] **L-46945**
- Upper crustal structure of Deception I. area [1992, eng] **L-47330**

Denman Glacier
- New U-Pb zircon ages from the Denman Glacier area [1992, eng] **E-47328**

Depot Peak
- Geology and structure of Depot Peak [1992, eng] **E-46859**

Derrick Peak
- Additional fragments of the Derrick Peak meteorite [1991, eng] **E-45719**

Dido, Mount
- Factors affecting the distribution of yeasts in the Antarctic Ross Desert [1987, eng] **B-46909**

Discovery Bay
- Marine benthos in Discovery Bay [1990, spa] **B-46695**
- Ocean currents in Discovery Bay [1990, spa] **J-46691**
- Physical and biological characteristics of the water column in Discovery Bay [1990, spa] **J-46692**

Dolleman Island
- Seasonal input of heavy metals to antarctic snow [1992, eng] **F-47248**
- Ratio of MSA to non-sea-salt sulphate in Antarctic Peninsula ice cores [1992, eng] **I -47243**
- Pattern of ocean-atmosphere exchange in a Weddell Sea ice core [1992, eng] **I-47254**

Dome A
- Has European cooperation begun in Antarctica [1990, rus] **I-46110**

Dominion Range
- Study of methanesulfonic acid in ice cores [1991, eng] **F-46867**

Doumer Island
- Element distribution in soils of the Antarctic Peninsula and Chile [1991, eng] **E-45235**

Drake Passage
- *Thysanoessa macrura* (Euphausiacea) in Bransfield Strait region [1992, eng] **B-46921**
- Meteorological measurements using drifting buoys [1989, eng] **I-46627**
- Biosiliceous particle flux in the southern ocean [1991, eng] **J-46244**
- Predictive bio-optical relationships for polar oceans and marginal ice zones [1992, eng] **J-46301**
- Thermal structure and surface distribution of chlorophyll *a* in Drake Passage, 1989-1990 [1990, spa] **J-46693**
- Formation of Antarctic Intermediate and Bottom Waters in oceanic GCMs [1992, eng] **J-46809**
- Oceanographic activities during the 1986-1988 expeditions [1989, spa] **J-47152**
- Investigation of carbon dioxide in the South Atlantic and northern Weddell Sea areas (WOCE Sections A-12 and A-21) during the METEOR expedition 11/5, January-March 1990 [1991, eng] **J-47314**
- Comparison between the total geomagnetic field reference values and those measured in the Drake Passage [1990, spa] **L-45123**

Dumont d'Urville Station
- Daily pattern of melatonin secretion in the Emperor Penguin [1991, eng] **B-45367**
- Enzyme from an antarctic psychrotroph [1992, eng] **B-46076**
- Chemical composition of falling snow at Dumont d'Urville, Antarctica [1992, eng] **F-46429**
- French Polar Expeditions [1987, fre] **G-45812**
- Monthly averages of geomagnetic components X, Y and Z at Dumont d'Urville [1990, spa] **K-45137**

Dyer Plateau
- Glaciology of Dyer Plateau [1990, eng] **F-45918**

East Antarctica
- Descriptions of two new genera of Asellota from the deep sea [1992, eng] **B-46409**
- Gametogenesis and sexual cycles in notothenioids from East Antarctica [1992, eng] **B-46829**
- Changes in the east antarctic ice sheet during the last glaciation [1991, eng] **E-45089**
- Marine microfossils in till clasts of the Elephant Moraine on the east antarctic ice sheet [1990, eng] **E-45830**
- Middle Eocene-Oligocene calcareous nanofossil on Maud Rise [1990, eng] **E-45911**
- Sources of data on the Quaternary of East Antarctica [1991, eng] **E-46491**
- Formation of an east antarctic ice sheet in Eocene/Oligocene time [1992, eng] **E-46811**
- Rauer Group wollastonite-scapolite assemblages [1992, eng] **E-46906**
- New U-Pb zircon ages from the Denman Glacier area [1992, eng] **E-47328**
- Late Cenozoic glacial history of the Terra Nova Bay region [1990, eng] **F-46062**

Climatic significance of ice crystals in an ice core [1992, chi] **F-46596**
Antarctic ice sheets at risk? [1992, eng] **F-47304**
Unfavorable weather conditions for air navigation during summer [1990, rus] **I-45671**
Plateau weather: a synoptic study of IAGO and ANARE AWS observations in East Antarctica [1991, eng] **I-45987**
Has European cooperation begun in Antarctica [1990, rus] **I-46110**
Derivation of polar cap AE indices [1992, eng] **K-47179**
Earth crust and effective topography of Antarctica [1989, rus] **L-45253**
Configuration and structure of the subglacial crust [1991, eng] **L-46343**

East Ongul Island
Magnetic survey on Ongul I. [1991, eng] **L-46193**

Ekelöf Point
Dinoflagellate cysts from the Rabot Member (Santa Marta Formation) of eastern James Ross Island [1992, eng] **E-46881**

Ekström Ice Shelf
Tension faults on Ekström Ice Shelf [1992, ger] **C-47370**

Elephant Island
Effect of sea ice on krill population structure around Elephant and South Orkney Is. [1991, eng] **B-45317**
Differences in target strength of krill swarms at 38 and 120 kHz [1991, eng] **B-45414**
Variation in reproductive status of krill swarms [1992, eng] **B-46923**
Stratigraphic and paleoclimatic studies of a 5500-year-old moss bank on Elephant Island, Antarctica [1991, eng] **E-45393**
Bathymetry around Elephant and Clarence Islands [1990, eng] **E-45910**
Total organic carbon in the antarctic sea ice zone, 1988-89 [1991, eng] **J-46221**

Ellsworth Mountains
Glacial deposition in Antarctica and Utah [1991, eng] **E-45551**
Field collection for apatite fission track analysis, Ellsworth Mountains [1990, eng] **E-45837**
Late Gondwanide tectonic rotations within Gondwanaland [1992, eng] **E-46806**

Enderby Land
Lecideoid lichens from Enderby Land [1991, eng] **B-46740**
Limnology and allelopathic effects on the algal ecology [1992, eng] **B-47041**
Feeding behavior of juvenile notothenioids in Prydz Bay and off Enderby Land [1992, eng] **B-47261**
Juxtaposition of India, Sri Lanka, Antarctica in Proterozoic to Mesozoic Gondwana [1990, eng] **E-46402**
Relationship between mean delta 0-18 values of surface snow and air temperature [1992, eng] **F-46559**
Ice surface features in East Antarctica [1992, eng] **F-46561**
Position, elevation, ice thickness and bedrock elevation of stations along the routes in East Queen Maud Land and Enderby Land, East Antarctica [1992, eng] **F-46755**
Seismic exploration with penetrator in Queen Maud Land [1991, eng] **L-46195**

Erebus, Mount
Strain of the cyanobacterium *Mastigocladus laminosus* Cohn from Mt. Erebus [1991, eng] **B-46812**
Melt inclusions in anorthoclase phenocrysts from Mount Erebus [1990, eng] **E-45823**
Volatile emissions from Mount Erebus [1990, eng] **E-45824**
Uranium and thorium chronology of phonolite at Mount Erebus [1992, eng] **E-46048**
Temperature measurements in the crater of Mt. Erebus [1991, eng] **E-46198**
Robot mission in Antarctica [1992, eng] **E-46902**
Petrologic evolution of anorthoclase phenolite lavas on Mount Erebus [1992, eng] **E-46905**
Planned robot descent into Mount Erebus [1992, eng] **G-46414**
Seismic activity on Mount Erebus in 1989 [1991, eng] **L-46196**
Extraction of microearthquake signals from noise data on Mt. Erebus [1991, eng] **L-46197**

Esperanza Station
Levels of anxiety in polar environments [1991, eng] **H-46973**

Executive Committee Range
Austral summer 1989-1990 at the Executive Committee Range, Marie Byrd Land, Antarctica [1990, eng] **E-45822**

Falkland Islands
Review of *Pariphimedia* and redescription of the two antarctic species [1991, eng] **B-45094**
Bird life in the Falkland Is. [1991, ice] **B-45163**
Biometrical analysis of the South American *Elymus glaucescens* complex *(Poaceae: Triticeae)* [1989, eng] **B-45175**
Chlorobiphenyls and organochlorine pesticides in various sub-antarctic organisms [1991, eng] **B-45340**
Coastal South American King and Blue-eyed Shags [1991, eng] **B-45378**
Freshwater amphipoda of the Falkland Islands [1991, eng] **B-45610**
Discards from squid trawlers as food for Falkland Is. albatrosses [1992, eng] **B-45720**
Allozymes and morphometric characteristics in three *Mytilus* species [1991, eng] **B-45721**
Diet of antarctic squid: comparison of conventional and serological gut contents analyses [1992, eng] **B-46407**
Post-recruit growth of the Patagonian squid *Loligo gahi* (d'Orbigny) [1991, eng] **B-46960**
Lichen family Cladoniaceae in the Falkland Islands [1992, eng] **B-47294**
British dependent territories in antarctic regions [1992, eng] **M-47172**

Faraday Station
Group delay times of whistler signals at Faraday VLF transmitter [1992, eng] **K-45390**

Ferrar Glacier
Low pressure/high temperature metamorphism of Koettlitz Group schists [1992, eng] **E-46977**

Filchner Ice Shelf
Filchner-Ronne Ice Shelf programme, Report 3 (1986) [1986, eng] **F-45490**
Ice rises and ice rumples [1986, eng] **F-45491**
Flowline on Ronne Ice Shelf [1986, eng] **F-45493**
Glaciological geodesy on Filchner Ice Shelf 1983-86 [1986, eng] **F-45495**
Satellite image maps as a tool for glaciology [1986, eng] **F-45496**
Discharge of ice into the Filchner-Ronne ice shelves [1986, eng] **F-45497**
Ice core studies on the Filchner-Ronne Ice Shelf [1986, eng] **F-45498**
Ice core drilling on Dolleman Island [1986, eng] **F-45499**
NARE 1984-1985 glaciological research [1986, eng] **F-45501**
Sea bottom topography beneath Ronne Ice Shelf [1986, eng] **F-45503**
Central part of the Filchner-Ronne Ice Shelf [1986, eng] **F-45504**
Finite element modelling of the Filchner-Ronne Ice Shelf [1986, eng] **F-45507**
On the flow within the transition zone between ice sheet and ice shelf [1986, eng] **F-45508**
Filchner-Ronne Ice Shelf programme, Report 4 (1990) [1990, eng] **F-45514**
Glaciological fieldwork on Ronne Ice Shelf, 1985-1988 [1990, eng] **F-45515**
Surface undulations where Rutford Ice Stream enters Ronne Ice Shelf [1990, eng] **F-45516**
Ice velocity, flow line, and deformation determination from GPS and Transit at Filchner Ronne Ice Shelf [1990, eng] **F-45517**
520 year temperature record of a 100 m core from the Ronne Ice Shelf, Antarctica (extended abstract) [1990, eng] **F-45518**
Stratigraphy of a 16 m firn core near Druzhnaya I [1990, eng] **F-45519**
British Antarctic Survey on Ronne Ice Shelf, 1988/89 [1990, eng] **F-45520**
Ice—ocean interaction on Ronne Ice Shelf, Antarctica [1990, eng] **F-45521**
Glacial geodetic investigations on Filchner-Ronne Ice Shelf 1989/90 [1990, eng] **F-45522**
ERS-1 altimeter activities in Antarctica [1990, eng] **F-45523**
Unmanned submersibles: the development of AUTOSUB within NERC, UK [1990, eng] **F-45524**
Contemporary and Cenozoic glaciomarine processes of Antarctica: the Filchner-Ronne Ice Shelf [1990, eng] **F-45525**
Glaciological data [1990, eng] **F-45526**
Glaciological data: geodetic measurements [1990, eng] **F-45527**
Satellite image map series of Filchner-Ronne Ice Shelf 1:2,000,000 [1990, eng] **F-45528**
Satellite image maps of Filchner Ice Shelf at 1:250,000 scale [1990, eng] **F-45529**
Digital Antarctic Coastline [1990, eng] **F-45530**
MSSL Science Plan [1990, eng] **F-45531**
Glaciology of Filchner-Ronne Ice Shelf, 1989/90 [1990, eng] **F-45532**
Analysis of meteoric and marine ice of the Filchner-Ronne Ice Shelf [1990, eng] **F-45533**

Filchner Ice Shelf *(cont.)*
- Hot water drilling in ice shelf/ocean boundary studies [1990, eng] **F-45534**
- One-dimensional model of ice shelf-ocean interaction [1990, eng] **F-45535**
- Melt rates and mass balances, bottoms of Filchner/Ronne ice Shelves [1990, eng] **F-45922**
- Evidence for basal marine ice in the Filchner-Ronne ice shelf [1992, eng] **F-46739**
- Accumulation on the Filchner and Ronne Ice Shelves [1990, ger] **F-47310**
- Thermohaline circulation beneath the Filchner-Ronne ice shelves [1991, eng] **J-45226**
- Oceanographic research during NARE-84/85 [1986, eng] **J-45509**

Filchner Station
- Sketch on West Germany antarctic station [1991, jpn] **G-47015**

Fildes Peninsula
- Joint Japanese-Chinese terrestrial biology program in 1990-1991 [1992, jpn] **B-46753**
- Formation and evolution of Tertiary volcanic rocks from the Great Wall Station area [1991, chi] **E-45466**
- Stratigraphic correlation and isotope age of volcanic rocks from Fildes Peninsula [1991, chi] **E-45468**
- Paleoclimate of King George I. [1991, chi] **E-46442**
- Periglacial-geomorphological processes on Fildes Peninsula [1991, chi] **E-46450**
- Mechanism of island-arc volcanism on Fildes Peninsula [1992, eng] **E-46578**
- Active layers of Fildes Peninsula [1991, eng] **E-46850**
- Trace element geochemistry in vulcanites from Fildes Peninsula [1989, spa] **E-47156**
- Hydrographic survey program [1989, spa] **J-47153**
- Paleomagnetism of rocks from Fildes Peninsula [1991, chi] **L-45469**

Fimbul Ice Shelf
- Glaciological and oceanographic studies on the Fimbul Ice Shelf, 1989-1990 [1990, eng] **F-45536**

Ford Ranges
- Geology of metamorphic rocks and granitoids: Ford Ranges of western Marie Byrd Land [1990, eng] **E-45821**

Fosdick Mountains
- Geology of metamorphic rocks and granitoids: Ford Ranges of western Marie Byrd Land [1990, eng] **E-45821**

Fryxell, Lake
- Sulfur cycling in Lake Fryxell [1990, eng] **B-46318**
- Bacterial biomass and heterotrophic activity in Lake Fryxell [1990, eng] **B-46319**
- Aquatic fulvic acids in two antarctic desert lakes [1991, eng] **E-45152**

Georg von Neumayer Station
- UV radiation dosimetry with *B. subtilis* spores [1992, eng] **B-47139**
- Tension faults on Ekström Ice Shelf [1992, ger] **C-47370**
- Microwave signature measurements of antarctic firn [1991, eng] **F-46504**
- Vertical axis wind turbine with integrated magnetic generator [1991, eng] **G-45956**
- Sketch on West Germany antarctic station [1991, jpn] **G-47015**
- Regular fluctuations of surface ozone at Georg-von- Neumayer Station, Antarctica [1992, eng] **I-45807**
- Condensation nuclei measurements at the Georg von Neumayer Station (F.R.G.), coastal Antarctica [1991, eng] **I-46591**
- Atmospheric turbidity at the antarctic coastal station Georg-von-Neumayer (70S, 8W, 40 m MSL) [1992, eng] **I-47049**
- Tropospheric alkanes and acetylene long-term measurements [1992, eng] **I-47239**
- Condensation nuclei at Georg von Neumayer Station [1992, eng] **I-47245**

George V Coast
- Modern radiolaria of the continental shelf of East Antarctica [1992, eng] **B-46887**
- Diatoms from the George V Coast [1992, eng] **B-47043**
- Glacial advance in East Antarctica during the Hypsithermal [1991, eng] **E-45097**

George VI Ice Shelf
- George VI Ice Shelf: a temperate ice shelf [1986, eng] **F-45500**
- Tidal spectrum underneath antarctic ice shelves [1986, eng] **F-45505**

Gerlache Inlet
- Metal binding sites in kidney of scallop [1992, eng] **B-46941**

Gerlache Strait
- Spring bloom dynamics [1990, eng] **B-46009**
- Phytoplankton distribution and primary productivity during spring bloom [1990, eng] **B-46014**
- RACER: phytoplankton of the northern Gerlache Strait [1990, eng] **B-46015**
- Microbiology of northern Gerlache Strait, 1989-1990 [1990, eng] **B-46018**
- Bacteria and protozoan grazing in 1989 spring bloom [1990, eng] **B-46020**
- Zooplankton studies during the spring bloom of 1989 [1990, eng] **B-46021**
- RACER: egg production of *Calanoides acutus* during the spring bloom, 1989 [1990, eng] **B-46022**
- RACER: Carbon egestion rates of *Euphausia superba* [1990, eng] **B-46023**
- RACER: Phaeopigment photooxidation during the spring bloom in northern Gerlache Strait [1990, eng] **B-46024**
- Phytoplankton growth and zooplankton grazing in Gerlache Strait [1990, eng] **B-46025**
- Particle flux during the 1989-1990 summer [1990, eng] **B-46026**
- *Thysanoessa macrura* larvae in 1986-1987 [1990, eng] **B-46028**
- Feeding behavior of a carnivorous copepod in Gerlache Strait [1991, eng] **B-46840**
- *Thysanoessa macrura* (Euphausiacea) in Bransfield Strait region [1992, eng] **B-46921**
- Sediment geochronologies for high-latitude continental shelf deposits [1992, eng] **E-46728**
- Gerlache Strait meteorology during spring bloom [1990, eng] **I-46010**
- Gerlache Strait surface waters during spring bloom [1990, eng] **J-46011**
- Lagrangian drifters in the Gerlache and Bransfield Straits [1990, eng] **J-46012**
- Microbial uptake and ammonium regeneration during the spring bloom [1990, eng] **J-46019**

Gough Island
- Newsletter/Nuusbrief, No.507, June 1991 [1991, eng] **A-46964**
- Newsletter/Nuusbrief, No.509, Aug. 1991 [1991, eng] **A-46965**
- Newsletter/Nuusbrief, No.510, Sep. 1991 [1991, eng] **A-46966**
- Newsletter/Nuusbrief, No.514, Jan. 1992 [1992, eng] **A-46967**
- Newsletter/Nuusbrief, No.515, Feb. 1992 [1992, eng] **A-46968**
- Newsletter/Nuusbrief, No.516, Mar. 1992 [1992, eng] **A-46969**
- Newsletter/Nuusbrief, No.517, Apr. 1992 [1992, eng] **A-46970**
- Newsletter/Nuusbrief, No.518, May 1992 [1992, eng] **A-47163**
- Newsletter/Nuusbrief, No.500, Nov. 1990 [1990, eng] **A-47207**
- Bill morphology and diet of a filter-feeding seabird at Gough I. [1992, eng] **B-47124**
- Relationships between atmospheric circulation and rainfall in the South African region [1991, eng] **I-47206**

Great Wall Station
- Joint Japanese-Chinese terrestrial biology program in 1990-1991 [1992, jpn] **B-46753**
- Phytoplankton distribution in the Great Wall Bay [1992, chi] **B-46891**
- Determination of rare earths and other trace elements [1991, eng] **E-45449**
- Formation and evolution of Tertiary volcanic rocks from the Great Wall Station area [1991, chi] **E-45466**
- REE in the bay sediments near the Great Wall Station [1991, chi] **E-46451**
- Sediment geochemistry of Xihu Lake, Great Wall Station [1992, eng] **E-47126**
- Ecology of colored fast ice in coastal waters off the Great Wall Station [1991, eng] **F-45463**
- Snow accumulation and melting at the Great Wall Station [1991, chi] **F-46448**
- China's antarctic earth sciences observatories [1990, eng] **G-45451**
- Summer bottom water temperature in the Great Wall Bay [1991, chi] **J-46446**
- HF field strength measurements over a very long distance [1991, eng] **K-45464**
- Geomagnetic pulsations at the Great Wall Station and Beijing [1992, chi] **K-46895**

Haag Nunataks
- New aeromagnetic and bedrock elevation data from the area around Haag Nunataks, West Antarctica [1986, eng] **F-45502**

Half Moon Island
- Count of breeding birds at Half Moon I. [1991, eng] **B-47315**
- Origin of the compositional variations of the Half Moon I. plutonic complex [1991, eng] **E-45784**

Halley Station
- Microbarograph for internal gravity wave studies [1992, eng] **I-46374**
- Eddies in the stable atmospheric boundary layer [1991, eng] **I-46567**
- Trace splitting of whistlers [1992, eng] **K-46415**
- Case study of plasma structure in the dusk sector associated with enhanced magnetospheric convection [1992, eng] **K-46976**

Heard Island
- Fur seal autumn-winter diet around Heard I. [1991, eng] **B-45219**
- Southern elephant seal foraging in the southern ocean [1991, eng] **B-45580**
- Feeding ecology of penguins at Heard Island with special emphasis on king penguins [1991, eng] **B-45589**
- Fisheries investigations in the Heard Island AFZ [1991, eng] **B-45593**
- Weevil assemblages on sub-antarctic islands [1992, eng] **B-46059**
- Prions *Pachyptila* and diving petrels on Heard I. [1991, eng] **B-46469**
- Accumulation of anthropogenic marine trash on Heard and Macquarie Is. [1991, eng] **J-45816**
- Heard Island experiment [1991, eng] **J-45889**

Heimefront Range
- Sedimentary and petrographic characterization of diamictites from the Beacon Super-Group, Kottas-Berge, Heimefront Range (Antarctica) [1989, ger] **E-45444**
- Structural evolution and cooling of the Heimefront Range [1991, ger] **E-45487**
- Age and composition of rocks from the Heimefront Range [1991, eng] **E-46177**

Hell Gates
- Isotopic composition of ice samples from the Hells Gate and Backstairs Passage Glacier [1991, eng] **F-45762**
- Ice flow and surficial variations of Larsen Ice Shelf and Nansen Ice Sheet [1991, eng] **F-45765**

Hells Gate
- Hells Gate and Backstairs Passage ice shelves, Victoria Land, Antarctica [1988, eng] **E-45702**

Henry Ice Rise
- Ice rumples between Korff and Henry ice rises [1986, eng] **F-45506**

Hoare, Lake
- Aquatic fulvic acids in two antarctic desert lakes [1991, eng] **E-45152**
- Oxygen supersaturation in ice-covered antarctic lakes [1992, eng] **E-45461**
- Oxygen supersaturation in ice-covered antarctic lakes [1992, eng] **F-46049**
- Implications of lake ice cover thickness change for local climatology [1992, eng] **F-46437**
- Computational modeling of antarctic lake ice [1992, eng] **F-47357**

Hope Bay
- Effect of food temperature on Adélie penguins' metabolic rate [1991, eng] **B-45161**
- Effects of implanted or attached instruments on Adélie penguins [1991, eng] **B-45601**
- Effects of oil pollution of antarctic penguins [1991, eng] **B-45817**

Humps Island
- Palynology of the Marambio Group (Upper Cretaceous) of northern Humps Island [1992, eng] **E-46882**
- Dinoflagellate cysts from the Marambio Group (Upper Cretaceous) of Humps Island [1992, eng] **E-46883**

Ice Stream B
- Estimating ice temperature from short records in thermally disturbed boreholes [1991, eng] **F-45545**

Indian Ocean
- Copepods collected along 13E of the Indian Ocean in summer 1973 [1991, eng] **B-45180**
- PCBs and organochlorine pesticides in Indian Ocean plankton [1991, eng] **B-45221**
- Krill resources in CCAMLR Divisons 58.4.2 and 58.4.3, 1988-1990 [1991, eng] **B-45419**
- Life cycle of *Trematomus eulepidotus* (Nototheniidae) in the Indian Ocean [1991, eng] **B-45600**
- Observations on Indian Ocean seabirds [1992, eng] **B-46070**
- Multiple sightings of a Royal Albatross *Diomedea epomophora* in the southern Indian Ocean [1991, eng] **B-46474**
- Antarctic rock cod genus *Nototheniops* from the Indian Ocean [1992, eng] **B-46479**
- Copepods collected in the Antarctic along longitude 33.5E in 1976 [1992, eng] **B-46750**
- Scuba-diving survey of sublittoral macrobenthos at Marion I. [1992, eng] **B-46822**
- Resolving an isotopic boundary within the Australian-Antarctic Discordance [1992, eng] **E-47048**
- Early Oligocene ice sheet expansion on Antarctica [1992, eng] **F-47292**
- Surface currents and thermal fronts in the southern Indian Ocean [1990, eng] **J-45265**
- Physico-chemical and biological studies in the ice edge zone of the Indian Ocean [1992, eng] **J-46071**
- Biogenic silica accumulation in the Indian Ocean [1991, eng] **J-46245**
- Entrainment of circumpolar water in the Indian Ocean region of the Antarctic [1990, eng] **J-47224**
- Satellite evidence of semiannual baroclinic Rossby waves in the Indian Ocean [1990, fre] **J-47272**

Jakobshavns Isbrae
- Glacier, river and sea ice blister observations [1992, eng] **F-47213**

James Ross Island
- Magnetic anomalies over the James Ross Island and surrounding areas [1992, spa] **C-47285**
- Geochemical study of inoceramid bivalves from James Ross I. [1990, eng] **E-45098**
- Decapod crustaceans from James Ross I. [1990, eng] **E-45840**
- Cretaceous hermit crab and bryozoan symbiosis [1992, eng] **E-46369**
- James Ross Basin workshop [1992, eng] **E-46373**
- Interaction of tectonic and glacial processes near the Antarctic Peninsula [1991, eng] **E-46611**
- Petrographic evolution of an active margin sedimentary sequence [1991, eng] **E-46722**
- Jurassic-Tertiary stratigraphy and palynology of the James Ross Basin [1992, eng] **E-46877**
- Dinoflagellate cysts from an allochthonous block of Nordenskjöld Formation [1992, eng] **E-46878**
- Stratigraphical palynology of the Kotick Point and Whisky Bay formations [1992, eng] **E-46879**
- Palynology of the Lachman Crags Member, Santa Marta Formation [1992, eng] **E-46880**
- Isotope geochemistry of concretions from James Ross I. [1991, eng] **E-46956**
- Campanian-Maastrichtian stratigraphy of James Ross I. [1991, eng] **E-46961**
- Ichnology of a submarine braided channel complex [1992, eng] **E-47001**
- Geology of James Ross Island [1992, spa] **E-47273**
- Geomorphology of James Ross Island [1992, spa] **E-47274**
- Aptian-Campanian (Upper Cretaceous) biostratigraphy of James Ross Island [1992, spa] **E-47275**
- Late Cretaceous ammonite assemblages of the Santa Marta Formation, James Ross Island [1992, spa] **E-47276**
- Upper Cretaceous of southeastern James Ross Island [1992, spa] **E-47277**
- Late Cretaceous Rabot Formation, James Ross Island [1992, spa] **E-47278**
- Stratigraphy of the Gustav Group on James Ross Island [1992, spa] **E-47280**
- Fauna of Cabo Polanski, James Ross Island [1992, spa] **E-47281**
- New localities of Late Cretaceous outcrops of the Santa Marta Formation on James Ross Island [1992, spa] **E-47282**
- Trace fossils from the Cretaceous Gustav Group, James Ross Island [1992, spa] **E-47283**
- Evolution of Cretaceous depositional systems in the Gustav Group of James Ross Island [1992, spa] **E-47284**
- Seismic study on James Ross Island [1992, spa] **E-47286**
- Paleomagnetism in sedimentary rocks of James Ross Island [1992, spa] **E-47287**
- Structural features of northeastern Antarctic Peninsula and of James Ross Island [1992, spa] **E-47288**
- Palynology of the Santa Marta Formation, Upper Cretaceous of James Ross Island [1992, spa] **E-47289**
- Glacial history of James Ross Island [1992, eng] **E-47367**

Juan Carlos I Station
- Geodesic linking between Antarctica and Tierra del Fuego [1990, spa] **C-45118**
- Mineralogic and microsonde analysis of volcanic ash in the vicinity of Juan Carlos I Station [1989, spa] **E-47234**
- Drainage of the Cazadora Glacier at Juan-Carlos I Base [1991, eng] **F-46844**
- Record of the 1988-1989 expedition at the Spanish Juan Carlos I Station [1989, spa] **F-47227**
- Correlation between discharge and hydrochemical parameters in the river at Juan Carlos I Station [1989, spa] **F-47228**
- Meteorological data and hydrogram of the river at Juan Carlos I Station [1989, spa] **F-47229**

Juan Carlos I Station *(cont.)*
- Different water types found in the vicinity of Juan Carlos I Station [1989, spa] **F-47230**
- Stable isotope distribution in the Cazadora Glacier [1989, spa] **F-47231**
- Vertical distribution of some oligo-elements in the Cazadora Glacier near the Juan Carlos I Station [1989, spa] **F-47232**
- Structural analysis of the Cazadora Glacier ice, directional anisotropy quantification and subglacial drainage prediction [1989, spa] **F-47233**
- Plans for the construction of a dam in a fossil lagoon near the Juan Carlos I Station [1989, spa] **G-47235**

Kara Sea
- Model of the interaction of polar atmosphere-ocean-ice cover [1991, eng] **F-46653**
- Physical and dynamic properties of sea ice in the polar oceans [1991, eng] **F-47180**

Kerguelen Islands
- Unusual plumage in Royal Shags *Phalacrocorax albiventer* from Kerguelen Is. [1989, fre] **B-45104**
- Polymorphism of mitochondrial DNA in subantarctic mussels [1990, eng] **B-45165**
- Appendage activity and feeding behavior in Kerguelen Is. copepod [1991, eng] **B-45356**
- Algal pigment diversity in coastal sediments from Kerguelen Is. [1991, eng] **B-45357**
- Giant kelp and growth of bacteria [1991, eng] **B-45406**
- Additional data on subantarctic ichthyofauna of the French southern islands [1982, fre] **B-45709**
- Allozymes and morphometric characteristics in three *Mytilus* species [1991, eng] **B-45721**
- Cytogenetic study of two plants from the Kerguelen Is. [1992, eng] **B-45854**
- Weevil assemblages on sub-antarctic islands [1992, eng] **B-46059**
- Growth dynamic of a sea urchin from Kerguelen Islands [1992, fre] **B-46766**
- Degradation of gut pigment in an antarctic copepod [1992, eng] **B-46871**
- Notocanthidae: Spiny eels [1990, eng] **B-47068**
- Alepocephalidae: Slickheads [1990, eng] **B-47072**
- Lactate dehydrogenase of the icefish heart [1991, eng] **B-47111**
- Aspects of the breeding and feeding of Kerguelen and Antarctic terns at the Kerguelen Islands [1991, eng] **B-47212**
- Morphometric variability in the Kerguelen cormorant and the gentoo penguin [1992, eng] **B-47263**
- Jeanne d'Arc and Ronarc'h peninsulas: an experimental area for a Kerguelen geological map [1990, fre] **E-47271**
- Propagation of planetary waves trapped by a zonal escarpment [1990, fre] **J-47270**

Kerguelen Plateau
- Icefish from the Kerguelen Plateau [1991, eng] **B-46529**
- Mineralizations and rifting on the Kerguelen-Heard Plateau [1991, fre] **E-45368**
- South Polar Front position near Kerguelen and Heard Is. in the fall of 1987 [1990, eng] **J-45370**
- Western boundary current of the eastern flank of the Kerguelen Plateau [1991, eng] **J-45594**

King George Island
- Environmental management on King George I. [1991, eng] **A-45088**
- Rock pigeon and blue petrel in the South Shetland Is. [1991, eng] **B-45090**
- Effect of salinity on algae physiology [1991, eng] **B-45254**

King Sejong Station
- Information exchange of Korea Antarctic Research Program, 1990-1991 [1990, eng] **A-45102**
- GPS positioning of the King Sejong Station, Antarctica [1992, kor] **C-47050**
- Human elements for successful overwintering [1991, kor] **H-46085**
- Meteorological elements at King Sejong Station [1991, kor] **I-46078**
- Thermospheric temperature measurements at King Sejong Station [1991, eng] **K-45333**

Kitezh, Lake
- Spatial and temporal photosynthetic compartments in Lake Kitezh [1991, eng] **B-45192**

Koettlitz Glacier
- Glacier, river and sea ice blister observations [1992, eng] **F-47213**

Korff Ice Rise
- Ice rumples between Korff and Henry ice rises [1986, eng] **F-45506**

Kraul Mountains
- *Rinodina endophragmia,* a lichen from the Kraul Mountains, Queen Maud Land [1991, eng] **B-45714**

Krok Lake
- Plankton of oligotrophic freshwater lake [1991, eng] **B-45171**

Lamb, Cape
- Microplankton from the Cape Lamb Member, López de Bertodano Formation (Upper Cretaceous), Cape Lamb, Vega Island [1992, eng] **E-46884**
- Stratigraphy and sedimentology of Cape Lamb [1991, eng] **E-46957**
- Upper Cretaceous sedimentology and biostratigraphy of western Cape Lamb, Vega Island [1992, spa] **E-47279**

Lambert Glacier
- Workshop and seminar of the section on glaciology, Fall 1989 [1990, rus] **A-45110**
- Glacial history of the Lambert Glacier [1991, eng] **E-46483**

Langhovde Hills
- Net production of moss community in Langhovde Hills [1992, eng] **B-46749**

Meteorological data from the Langhovde Hills, summers of 1978-1989 [1992, eng] **I-46467**
Lapeyrère Bay
Circulation processes in Lapeyrère Bay and petroleum pollution [1991, eng] **J-46886**
Larsemann Hills
Ecology of *Catharacta maccormicki* near Zhongshan Station [1991, chi] **B-46452**
Diatom stratigraphy in antarctic freshwater lakes [1991, eng] **E-46487**
Radiation balance components over Larsemann Hills [1991, chi] **I-46445**
Larsen Ice Shelf
Geophysical study in the northern sector of the Antarctic Peninsula and the Larsen Ice Shelf [1990, spa] **F-45122**
Ice flow and surficial variations of Larsen Ice Shelf and Nansen Ice Sheet [1991, eng] **F-45765**
Law Dome
Firn stratigraphy, density and crystal structure on Law Dome [1991, eng] **F-46848**
Thermal properties of snow/firn on the Law Dome ice cap [1991, eng] **F-46851**
Parameters which influence the air content in polar ice [1992, eng] **I-47047**
Changes in tropospheric methane, 1841-1978, from ice core [1992, eng] **I-47242**
Lewis Cliff
Natural thermoluminescence in Lewis Cliff blue ice field meteorites [1990, eng] **E-45901**
Natural thermoluminescence of meteorites. 4. [1992, eng] **E-46397**
Rare earth elements in Angra dos Reis and Lewis Cliff 86010 [1990, eng] **E-46570**
Livingston Island
Lichen genus *Umbilicaria* on Livingston I. [1992, eng] **B-46366**
Ice-free area relationship to bird assemblages on Livingston I. [1992, spa] **B-46935**
Peperites and hydrothermal veins and breccias on Livingston I. [1992, eng] **E-45859**
Magnetic anomalies in southern Bransfield Strait [1990, spa] **L-46943**
Seismic profiles of the South Shetlands and Bransfield Strait [1990, spa] **L-46945**
Longing, Cape
Paleomagnetism in sedimentary rocks of Cape Longing [1991, spa] **E-45080**
Low Island
Colchicine binding by antarctic fish and bovine tubulins [1992, eng] **B-46607**
Icefish superoxide dismutase [1990, eng] **B-46799**
Lützow-Holm Bay
Distribution of the two types of ice diatom communities in the Antarctic [1992, eng] **B-46302**
Three species of amphipod crustaceans from Breid and Lützow-Holm Bays [1992, eng] **B-47031**
Antarctic geoscience transect QML-1A and QML-1B [1991, eng] **C-46462**
Trapped CO2 in east antarctic granulites [1991, eng] **E-46205**
Natural remanent magnetization of some rocks from southern Sri Lanka [1990, eng] **E-46401**
Juxtaposition of India, Sri Lanka, Antarctica in Proterozoic to Mesozoic Gondwana [1990, eng] **E-46402**
Review of *P-T* evolution of high-grade metamorphic terranes in East Antarctica [1990, eng] **E-46403**
Seasonal variation in particulate organic matter under fast ice [1992, eng] **J-47039**
Mac. Robertson Land
Caloplaca flora of the western antarctic region [1992, eng] **B-46803**
MacAlpine Hills
Overview of lunar highland meteorites, MacAlpine Hills [1991, eng] **E-45201**
Mineral-chemical comparisons of MAC 88105 with Yamato lunar meteorites [1991, eng] **E-45202**
Chemical composition of impact glass in lunar meteorites [1991, eng] **E-45203**
Impact melts in the lunar meteorite MAC88105 [1991, eng] **E-45204**
Chemical composition and petrology of MAC88104/5 [1991, eng] **E-45205**
Evidence of a lunar ferroan region from MAC88104/5 [1991, eng] **E-45206**
MAC88105: a lunar regolith breccia [1991, eng] **E-45207**
Geochemistry and petrography of the MacAlpine Hills lunar meteorites [1991, eng] **E-45208**
Lunar highland meteorites and the composition of the lunar crust [1991, eng] **E-45209**
MAC lunar meteorites' role in the composition and origin of the Moon [1991, eng] **E-45210**
History of two paired lunar meteorites [1991, eng] **E-45211**
Cosmogenic radionuclides in lunar meteorites [1991, eng] **E-45212**
Cosmic ray exposure ages of lunar meteorites recovered from Antarctica [1991, eng] **E-45213**
Thermoluminescence of lunar and basaltic meteorites [1991, eng] **E-45214**
Macquarie Island
Macquarie Island [1968, eng] **A-46029**
ANARE news, No.67 [1991, eng] **A-46190**

Newsletter/Nuusbrief, No.515, Feb. 1992 [1992, eng] **A-46968**
Newsletter/Nuusbrief, No.516, Mar. 1992 [1992, eng] **A-46969**
Newsletter/Nuusbrief, No.517, Apr. 1992 [1992, eng] **A-46970**
Newsletter/Nuusbrief, No.518, May 1992 [1992, eng] **A-47163**
Newsletter/Nuusbrief, No.500, Nov. 1990 [1990, eng] **A-47207**
Bacterial activity and production in the lakes of Marion I. [1991, eng] **B-45196**

Marion Island *(cont.)*
- Terrestrial slug recorded from sub-antarctic Marion Island [1992, eng] **B-45612**
- Introduction and extinction of trout in subantarctic stream [1992, eng] **B-45847**
- Soil nitrogen on Marion I. [1992, eng] **B-45852**
- Energy relations in penguin eggs [1992, eng] **B-46299**
- Control of feral cats on Marion I. [1992, eng] **B-46573**
- Hunting wild cats on Marion Island [1991, eng] **B-46767**
- Kelp *Macrocystis laevis* Hay at the Prince Edward Is. [1991, eng] **B-46816**
- Scuba-diving survey of sublittoral macrobenthos at Marion I. [1992, eng] **B-46822**
- Macroinvertebrates and litter nutrient release on Marion I. [1992, eng] **B-46847**
- Benthic Crustacea of Marion and Prince Edward Is. [1991, eng] **B-47165**
- Benthic Mollusca of Marion and Prince Edward Is. [1991, eng] **B-47166**
- Pycnogonida of Marion and Prince Edward Is. [1991, eng] **B-47167**
- Holothurians (Echinodermata) from Marion and Prince Edward Islands [1992, eng] **B-47221**
- Atmospheric carbon dioxide levels at Marion Island [1991, eng] **I-46252**
- Relationships between atmospheric circulation and rainfall in the South African region [1991, eng] **I-47206**

Mawson Coast
- Population estimates of emperor penguins, Mawson Coast, Antarctica [1991, eng] **B-45590**

Mawson Station
- Quarrying in Antarctica: Australian territory's rebuilding programme [1992, eng] **G-46094**
- Functional esthetics to enhance well-being in isolated and confined settings [1990, eng] **H-45297**
- Nitrogen and sulfur species in aerosols at Mawson, Antarctica, and their relationship to natural radionuclides [1992, eng] **I-46431**
- Influence of geomagnetic activity on vertical winds in the D region [1991, eng] **K-45391**
- Geomagnetic activity influence on horizontal winds in the D region [1991, eng] **K-45392**
- Variation of high-energy cosmic radiation [1991, eng] **K-45597**
- Ring effect in the sodium D2 Fraunhofer line of day skylight over Mawson, Antarctica [1992, eng] **K-46689**

Maxwell Bay
- Macrobenthic community of Maxwell Bay [1991, kor] **B-46081**
- High resolution seismic survey of Maxwell Bay [1991, eng] **E-45322**
- Diatoms in Holocene sediments of Maxwell Bay [1991, eng] **E-45328**

McMurdo Dry Valleys
- Photosynthesis in cryptoendolithic microbial communities [1991, eng] **B-45170**
- Moss sporophytes in extreme southern locations [1992, eng] **B-45851**
- Nematode ecology of the McMurdo Dry Valley ecosystems [1990, eng] **B-46317**
- Geochemical characteristics of antarctic lakes and ponds [1992, eng] **B-47035**
- Petrogenesis of orthogneisses in the McMurdo Dry Valleys [1991, eng] **E-45224**
- Exposure ages and erosion rates for bedrock samples from dry valleys [1990, eng] **E-45826**
- Siliceous crusts, quartz rinds and biotic weathering of sandstones in the cold desert of Antarctica [1991, eng] **E-47012**

McMurdo Ice Shelf
- Chromatographic analysis of reduced sulfur gases in antarctic waters following pre-concentration onto Tenax [1992, eng] **E-46687**

McMurdo Sound
- Physiology and population of the ascidian *Cnemidocarpa verrucosa* Lesson [1991, eng] **B-45178**
- Chemical defense in a common antarctic nemertean [1991, eng] **B-45237**
- Range of variation in respiration in two antarctic amphipods from Admiralty Bay [1991, eng] **B-45397**
- Nutrient stress in ice microalgae of McMurdo Sound in spring [1992, eng] **B-45849**
- Zooplankton comparisons in McMurdo Sound [1991, eng] **B-45871**
- Nutrients in sea ice and underlying layer of McMurdo Sound [1990, eng] **B-46264**
- Temperature and photosynthetic parameter alpha in sea-ice microalgae [1990, eng] **B-46265**
- Bacterioplankton at McMurdo Sound ice edge zone [1990, eng] **B-46266**
- Bacterial production in McMurdo Sound in spring [1990, eng] **B-46267**
- Bacteria and nano- and pico-phytoplankton in McMurdo Sound in spring [1990, eng] **B-46268**
- Fast ice flagellate and ciliate dominated microbial communities [1990, eng] **B-46269**
- Bacterioplankton seasonal changes in McMurdo Sound [1990, eng] **B-46270**
- Chemical bioactivity in marine invertebrates [1990, eng] **B-46273**
- Nutrition for invertebrate larvae in McMurdo Sound [1990, eng] **B-46274**
- Food and growth of sea star larvae in McMurdo Sound [1990, eng] **B-46276**
- Lipids in ctenophores and medusae [1990, eng] **B-46277**
- Morphology of notothenioids and cottoids [1990, eng] **B-46278**
- Antimicrobial activities of antarctic sponges [1992, eng] **B-46364**
- Biochemical systematics of Notothenioid fishes from Antarctica [1992, eng] **B-46638**
- UV radiation and photosynthetic production in antarctic sea ice microalgae [1992, eng] **B-46757**
- Auxospore formation in an antarctic diatom [1991, eng] **B-46758**
- Sampler for nutrients and Chl *a* in sea ice platelet layers [1992, eng] **B-46805**
- Susceptibility of the antarctic fish *Pagothenia borchgrevinki* to MS-222 anaesthesia [1992, eng] **B-46825**
- Behavior and breeding frequency of male Weddell seals [1992, eng] **B-46974**
- Hemorheological behavior of seal blood [1992, eng] **B-46985**
- Ecology of benthic foraminifera [1990, eng] **B-47116**
- Seasonal changes in the sea ice brine community, McMurdo Sound [1992, eng] **B-47141**
- Cardiovascular responses of two antarctic nototheniid fishes [1992, eng] **B-47337**
- Antarctic mapping program [1990, eng] **C-46520**
- Polar interglacial climatic conditions in McMurdo Sound [1991, eng] **E-45550**
- Holocene meltwater variations recorded in antarctic coastal marine benthic assemblages [1991, eng] **E-46034**
- Cenozoic glacial record in south Victoria Land [1991, eng] **E-46345**
- Travelling flexural waves in the Erebus Glacier Tongue, McMurdo Sound, Antarctica [1992, eng] **F-46569**
- Physical and dynamic properties of sea ice in the polar oceans [1991, eng] **F-47180**
- Winter oceanography in McMurdo Sound [1990, eng] **J-46000**

McMurdo Station
- Metabolic rate of diving Weddell seals [1992, eng] **B-47113**
- VISICE computer model: mathematical correlations between temperature, stress, and deflection [1991, eng] **G-45385**
- Mixing characteristics of submerged and surface wastewater outfalls at McMurdo Station [1992, eng] **G-46073**
- Nomographs for operating wheeled aircraft on sea-ice runways: McMurdo Station, Antarctica [1992, eng] **G-46500**
- U.S. Naval Support Force, Antarctica: McMurdo Station operations, 1989-1990 [1990, eng] **G-46521**
- U.S. Naval Support Force, Antarctica: detachment operations, 1989-1990 [1990, eng] **G-46522**
- U.S. Naval Support Force, Antarctica: ship operations, 1989-1990 [1990, eng] **G-46524**
- U.S. Navy Antarctic Development Squadron Six (VXE-6) activities, 1989-1990 [1990, eng] **G-46525**
- Field manual for the U.S. Antarctic Program [1992, eng] **G-47147**
- Landing and parking a C5 Galaxy on sea ice: McMurdo Station, Antarctica [1992, eng] **G-47355**
- Isolation and confinement effects in wintering-over group at McMurdo [1990, eng] **H-45288**
- Changes in thyroid hormone status with antarctic residence [1990, eng] **H-46320**
- Relations and performance of winter-over personnel at McMurdo [1990, eng] **H-46321**
- Ozone and aerosol vertical profiles at McMurdo, spring 1989 [1990, eng] **I-46323**
- U.S. Naval Support Force, Antarctica: weather operations 1989-1990 [1990, eng] **I-46523**
- Vertical profiles of ozone at McMurdo Station, Spring 1991 [1992, eng] **I-46644**
- Ozone depletion in Antarctica in 1991 [1992, eng] **I-47054**

Volcanic aerosol and ozone over Antarctica, Spring 1991 [1992, eng] **I-47303**
Unusual cosmic ray spike [1990, eng] **K-46512**
Establishment of a world park to protect the antarctic environment [1990, eng] **M-46141**

Melbourne, Mount
Isolation of five strains of thermophilic eubacteria in Antarctica [1991, eng] **B-45355**
Magnetic properties of volcanites from Mount Melbourne [1988, eng] **E-45707**
Crustal and mantle xenoliths from Mount Melbourne [1991, eng] **E-45786**
Structural evolution and volcanism in northern Victoria Land [1991, eng] **E-45788**
New petrological and geochemical data on Mt. Melbourne volcanic field [1991, eng] **E-45790**
Geological mapping of the Mt. Melbourne area [1991, eng] **E-45797**
Air-sea exchange and snow microcomponents [1991, eng] **J-46156**
Paleomagnetic data from the Mt. Melbourne volcanic area [1991, eng] **L-45801**
Mount Melbourne (Antarctica) geodetic network [1991, eng] **L-45806**

Melville Peak
Pleistocene age of the Melville Peak volcano, King George Island, West Antarctica, by K-Ar dating [1990, eng] **E-46863**

Mesa Range
Chemical and isotopic variations in lava flow from the Kirkpatrick Basalt [1992, eng] **E-47130**

Mirnyy Station
Atmospheric carbon monoxide, methane, and nitrous oxide in Antarctica [1990, rus] **I-45652**
Measuring atmospheric electrical properties over Mirnyy Station [1990, rus] **I-45655**
Indices of light scattering and transparency in the surface boundary layer [1990, rus] **I-45659**
Temperature and wind variations in the spring buildup of the free atmosphere [1990, rus] **I-45661**

Mizuho Plateau
Continuous 770-year record of volcanic activity from East Antarctica [1991, eng] **F-46953**
Wind and temperature regime in Mizuho Plateau, East Antarctica [1992, eng] **I-45616**

Mizuho Station
Workshop and seminar of the section on glaciology, Fall 1989 [1990, rus] **A-45110**
Estimating method of the precipitation in snow storms [1991, jpn] **F-45087**
Determination of methane concentration in air extracted from antarctic ice core samples [1991, eng] **F-46688**
Results of analyses of Mizuho 700 m ice core [1992, eng] **F-46756**
Air turbulence in the antarctic surface boundary layer and prognosis of geodetic refraction [1990, rus] **I-45675**
Polarization of irregular pulsations of diminishing period [1992, eng] **K-47301**

Molodezhnaya Station
Penetration of solar radiation into the artificially compacted snow of runways [1990, rus] **F-45646**
Remote radiometric determination of characteristics of artificially compacted snow covers [1991, rus] **F-46493**
Comparison of meteorological conditions at Molodezhnaya Station and adjacent runways [1990, rus] **I-45239**
GRID code information in meteorological support operations [1990, rus] **I-45242**
Autoregressive models for seasonal demarcation [1990, rus] **I-45649**
Atmospheric carbon monoxide, methane, and nitrous oxide in Antarctica [1990, rus] **I-45652**
Stratospheric processes during the 20th and 21st solar activity cycles [1990, rus] **I-45679**
Planetary wave energy and atmospheric thermodynamic regime in winter [1990, rus] **I-45680**
Strato-mesospheric processes over the Southern Hemisphere in winter 1985 [1990, rus] **I-45681**
Radiophysical investigations of the characteristics of cloudy atmosphere in Antarctica [1991, rus] **I-46494**

Mossman Peninsula
Diet of antarctic fur seals at Mossman Peninsula [1992, eng] **B-46823**

Mountaineer Range
Metamorphism in amphibolites and micaschists from the Dessent Formation [1988, eng] **E-45699**

Müller Ice Shelf
Growth of the Müller Ice Shelf during the Little Ice Age [1992, eng] **F-46889**

Nansen Ice Sheet
Ice flow and surficial variations of Larsen Ice Shelf and Nansen Ice Sheet [1991, eng] **F-45765**
Wind field observations by sodar system and AWS on the Nansen Ice Sheet [1992, eng] **I-47253**

Napier Mountains
Pressure of Proterozoic mafic dikes in the Vestfold Hills [1992, eng] **E-46917**

Nelson Island
Surface flow of Nelson ice cap, West Antarctica [1991, chi] **F-46441**
Chemistry of Nelson I. ice cover [1991, chi] **F-46447**

Neptune Range
New post-early Cambrian archaeocyath from Antarctica [1992, eng] **E-46808**

Newall Glacier
Glaciochemical investigations in southern Victoria Land [1990, eng] **F-45919**

Nils Larsen, Mount
Polar-wander path for Precambrian to Cambro-Ordovician from Mt. Nils Larsen [1991, eng] **E-46199**

Normanna Strait
Heart ventricle of the haemoglobinless icefish *Chaenocephalus aceratus* [1991, eng] **B-45086**

Northwest TerritoriesEllesmere Island
Levels of anxiety in polar environments [1991, eng] **H-46973**
Levels of anxiety in polar environments [1991, eng] **H-46973**

Norvegia, Cape
Seismic investigations off Cape Norvegia, eastern Weddell Sea [1991, ger] **E-45092**

Novolazarevskaya Station
Paleoenvironmental data from less-investigated polar regions [1991, eng] **F-46042**
Deciphering recent structures and Holocene evolution of the marginal East Antarctic ice cover [1991, eng] **F-46649**
Meteorological information and wind generators [1990, rus] **I-45648**

Ô-ike, Lake
Nutrient concentration changes in Lake Ô-ike [1992, eng] **B-47036**

Oates Coast
Kinematics of major structures of north Victoria and Oates Lands, Antarctica [1991, eng] **E-45781**

Ongul Island
Magnetic survey on Ongul I. [1991, eng] **L-46193**

Overlord, Mount
Structural evolution and volcanism in northern Victoria Land [1991, eng] **E-45788**

Pacific Ocean
Sources and transport of suspended calcites in Pacific Deep Water [1991, eng] **J-45158**

Palmer Archipelago
Antarctic birds: ecological and behavioral approaches [1992, eng] **B-46962**
Function and structure of fish brain and egg tubulins [1992, eng] **B-47373**

Palmer Station
Ultraviolet-absorbing compounds in antarctic organisms [1990, eng] **B-46257**
Phytoplankton physiology and UV radiation [1990, eng] **B-46258**
Ultraviolet radiation effects on photosynthetic rates of phytoplankton [1990, eng] **B-46259**
Oxygen and microalgal communities near Palmer Station [1990, eng] **B-46262**
Tintinnid cytoplasmic volume and biomass [1990, eng] **B-46263**
Intertidal zone at Palmer Station after the *Bahia Paraiso* spill [1990, eng] **B-46272**
Microtubule stabilizing in fish [1990, eng] **B-46280**
Predatory feeding behavior of an antarctic marine copepod [1991, eng] **B-46709**
Icefish superoxide dismutase [1990, eng] **B-46799**
U.S. Palmer Station in Antarctica [1991, jpn] **G-47014**
Life in Antarctica [1990, eng] **H-45271**
Stress during winter isolation [1990, eng] **H-46998**
Ozone and cloud properties from ultraviolet-monitor measurements at Palmer Station [1990, eng] **I-46322**
Contribution toward understanding the biospherical significance of antarctic ozone depletion [1992, eng] **I-46680**

Pedro Vicente Maldonado Station
- Vegetation cover of Canto Point, Greenwich I. [1990, spa] B-46696
- Site of the Ecuadorian antarctic station [1990, spa] G-46703

Pensacola Mountains
- Depositional setting of the Lower and Middle Cambrian in the Pensacola Mountains [1990, eng] E-45838
- Geology and crystallization of the Dufek intrusion [1991, eng] E-46339

Porthos Range
- Geochemistry of Proterozoic granulites from Prince Charles Mountains [1992, eng] E-45855

Possession Island
- King Penguin breeding biology and population dynamics [1992, eng] B-46309
- King Penguin diet at Possession Island [1992, eng] B-46310
- Have giant petrels *Macronectes* spp. really increased at Iles Crozet [1991, eng] B-46475
- Giant petrels *Macronectes* spp. increased at iles Crozet between 1966 and 1980 [1991, eng] B-46476

Potter Cove
- Age of juvenile *Notothenia rossii* from Potter Cove [1992, eng] B-46358

Priestley Glacier
- Geology of Priestley Formation and Early Paleozoic continental reconstruction [1991, eng] E-45771

Prince Charles Mountains
- Geochemistry of Proterozoic granulites from Prince Charles Mountains [1992, eng] E-45855
- Cenozoic history in northern Prince Charles Mountains [1991, eng] E-46482
- Glacial history of the Lambert Glacier [1991, eng] E-46483
- High-grade basement gneiss of the Prince Charles Mountains [1992, eng] E-46858

Prince Edward Islands
- Ornithological research at the Prince Edward Is. [1990, eng] B-45067
- Continued population increase of PEI fur seals [1990, eng] B-45068
- Environmental conservation at the Prince Edward Islands [1988, eng] B-46051
- Weevil assemblages on sub-antarctic islands [1992, eng] B-46059
- Mesozooplankton grazing impact on phytoplankton [1992, eng] B-46410
- Land-based predator impact on zooplankton and micronekton [1992, eng] B-46411
- Kelp *Macrocystis laevis* Hay at the Prince Edward Is. [1991, eng] B-46816
- Halosauridae: Halosaurs [1990, eng] B-47067
- Synaphobranchidae: Synaphobranchiids [1990, eng] B-47069
- Benthic Crustacea of Marion and Prince Edward Is. [1991, eng] B-47165
- Benthic Mollusca of Marion and Prince Edward Is. [1991, eng] B-47166
- Pycnogonida of Marion and Prince Edward Is. [1991, eng] B-47167
- Holothurians (Echinodermata) from Marion and Prince Edward Islands [1992, eng] B-47221
- Marine environment of Prince Edward Is. [1989, eng] J-45726

Princess Astrid Coast
- Ichthyoplankton studies in the Lazarev Sea [1992, eng] B-47262

Princess Ragnhild Coast
- *Nebaliella brevicarinata* n.sp. off the Princess Ragnhild Coast [1992, eng] B-47032
- MOS-1 multi-sensor data set for sea ice monitoring [1991, eng] F-46501

Prydz Bay
- Continuous plankton recorder survey of the Prydz Bay region [1991, eng] B-45582
- Diving behaviour of Adélie penguins in Prydz Bay [1991, eng] B-45592
- Karyotypes of two Channichthyidae from Prydz Bay [1987, eng] B-45713
- Phytoplankton-bacteria relationship in the antarctic marine ecosystem [1991, eng] B-46706
- Feeding behavior of juvenile nototheniods in Prydz Bay and off Enderby Land [1992, eng] B-47261
- Glacial advance in East Antarctica during the Hypsithermal [1991, eng] E-45097
- Structural and chemical processes in granulite metamorphism [1991, eng] E-45576
- Geological relationships in high-grade gneiss of the Brattstrand Bluffs coastline, Prydz Bay, East Antarctica [1991, eng] E-45878
- Clay minerals in antarctic waters [1992, eng] E-47044
- Stable O and C isotopes on Maud Rise and the Kerguelen Plateau [1992, eng] E-47045
- Algal pigments and their degradation in sea water [1991, eng] J-46866
- Southern ocean dimethyl sulfide concentrations [1992, eng] J-47359

Queen Maud Land
- *Rinodina endophragmia,* a lichen from the Kraul Mountains, Queen Maud Land [1991, eng] B-45714
- Larvae of euphausiids off Queen Maud Land [1992, eng] B-46819
- Cretaceous-Tertiary sea floor off Dronning Maud Land, Antarctica [1992, eng] E-46765
- Modeling glacier fluctuations in the Sör Rondane, Dronning Maud Land, Antarctica [1989, eng] F-45445
- Microwave signature measurements of antarctic firn [1991, eng] F-46504
- Relationship between mean delta 0-18 values of surface snow and air temperature [1992, eng] F-46559
- Ice surface features in East Antarctica [1992, eng] F-46561
- Late Quaternary glacio-climatic history of an East Antarctic ice sheet margin [1991, eng] F-46664
- Position, elevation, ice thickness and bedrock elevation of stations along the routes in East Queen Maud Land and Enderby Land, East Antarctica [1992, eng] F-46755
- Has European cooperation begun in Antarctica [1990, rus] I-46110
- Seismic exploration with penetrator in Queen Maud Land [1991, eng] L-46195

Queen Maud Mountains
- Structural evolution and cooling of the Heimefront Range [1991, ger] E-45487

Radok Lake
- Cenozoic history in northern Prince Charles Mountains [1991, eng] E-46482

Rauer Islands
- Mapping penguin rookeries using SPOT HRV data [1992, eng] C-46579

Ronne Ice Shelf
- Filchner-Ronne Ice Shelf programme, Report 3 (1986) [1986, eng] F-45490
- Ice rises and ice rumples [1986, eng] F-45491
- Flowline on Ronne Ice Shelf [1986, eng] F-45493
- Glaciological geodesy on Filchner Ice Shelf 1983-86 [1986, eng] F-45495
- Satellite image maps as a tool for glaciology [1986, eng] F-45496
- Discharge of ice into the Filchner-Ronne ice shelves [1986, eng] F-45497
- Ice core studies on the Filchner-Ronne Ice Shelf [1986, eng] F-45498
- Ice core drilling on Dolleman Island [1986, eng] F-45499
- NARE 1984-1985 glaciological research [1986, eng] F-45501
- Sea bottom topography beneath Ronne Ice Shelf [1986, eng] F-45503
- Central part of the Filchner-Ronne Ice Shelf [1986, eng] F-45504
- Finite element modelling of the Filchner-Ronne Ice Shelf [1986, eng] F-45507
- On the flow within the transition zone between ice sheet and ice shelf [1986, eng] F-45508
- Filchner-Ronne Ice Shelf programme, Report 4 (1990) [1990, eng] F-45514
- Glaciological fieldwork on Ronne Ice Shelf, 1985-1988 [1990, eng] F-45515
- Surface undulations where Rutford Ice Stream enters Ronne Ice Shelf [1990, eng] F-45516
- Ice velocity, flow line, and deformation determination from GPS and Transit at Filchner Ronne Ice Shelf [1990, eng] F-45517
- 520 year temperature record of a 100 m core from the Ronne Ice Shelf, Antarctica (extended abstract) [1990, eng] F-45518
- Stratigraphy of a 16 m firn core near Druzhnaya I [1990, eng] F-45519
- British Antarctic Survey on Ronne Ice Shelf, 1988/89 [1990, eng] F-45520
- Ice—ocean interaction on Ronne Ice Shelf, Antarctica [1990, eng] F-45521
- Glacial geodetic investigations on Filchner-Ronne Ice Shelf 1989/90 [1990, eng] F-45522
- ERS-1 altimeter activities in Antarctica [1990, eng] F-45523
- Unmanned submersibles: the development of AUTOSUB within NERC, UK [1990, eng] F-45524
- Contemporary and Cenozoic glaciomarine processes of Antarctica: the Filchner-Ronne Ice Shelf [1990, eng] F-45525
- Glaciological data [1990, eng] F-45526

Glaciological data: geodetic measurements [1990, eng] **F-45527**
Satellite image map series of Filchner-Ronne Ice Shelf 1:2,000,000 [1990, eng] **F-45528**
Satellite image maps of Filchner Ice Shelf at 1:250,000 scale [1990, eng] **F-45529**
Digital Antarctic Coastline [1990, eng] **F-45530**
MSSL Science Plan [1990, eng] **F-45531**
Glaciology of Filchner-Ronne Ice Shelf, 1989/90 [1990, eng] **F-45532**
Analysis of meteoric and marine ice of the Filchner-Ronne Ice Shelf [1990, eng] **F-45533**
Hot water drilling in ice shelf/ocean boundary studies [1990, eng] **F-45534**
One-dimensional model of ice shelf-ocean interaction [1990, eng] **F-45535**
Melt rates and mass balances, bottoms of Filchner/Ronne ice Shelves [1990, eng] **F-45922**
Gravity currents beneath ice shelves [1991, eng] **F-46658**
Evidence for basal marine ice in the Filchner-Ronne ice shelf [1992, eng] **F-46739**
Accumulation on the Filchner and Ronne Ice Shelves [1990, ger] **F-47310**
Thermohaline circulation beneath the Filchner-Ronne ice shelves [1991, eng] **J-45226**
One-dimensional model of ice shelf-ocean interaction [1991, eng] **J-45373**
Oceanographic research during NARE-84/85 [1986, eng] **J-45509**

Ross Ice Shelf
Changes in the west antarctic ice sheet [1991, eng] **F-45077**
Relict flow stripes on the Ross Ice Shelf [1991, eng] **F-45348**
Ice sheets and ice streams: thoughts on the Cordilleran Ice Sheet Symposium [1991, eng] **F-46137**
Interpretation of seismic data collected on floating ice [1992, eng] **F-47348**
Wind speed events and wind direction at Pegasus site during 1989 [1990, eng] **I-46330**
Satellite observation of katabatic-wind propagation for great distances across the Ross Ice Shelf [1992, eng] **I-47311**

Ross Island
Antarctica bound—From New Zealand [1992, eng] **A-47302**
Limnological properties of antarctic ponds during winter freezing [1991, eng] **B-45222**
Meteorological transport of continental soot to Antarctica [1992, eng] **I-45749**

Ross Sea
Antarctica: the Ross Sea region [1990, eng] **A-45996**
1992-1993 Italian Antarctic Expedition program [1992, ita] **A-47208**
New production in polar regions: the role of environmental controls [1991, eng] **B-45256**
Two new species of deepwater anglerfishes in the Ross Sea [1981, rus] **B-45715**
Species distribution of ostracods (Halocyprididae) in the Ross Sea [1992, eng] **B-46090**
Microalgae collected in the Ross Sea in 1988-1989 [1990, ita] **B-46117**
Ecological and evolutionary genetics of antarctic and subantarctic marine crustaceans [1990, ita] **B-46122**
Morphology and biology of ciliates from the Ross Sea [1990, ita] **B-46126**
Low temperature adaptation in antarctic teleosts [1990, ita] **B-46127**
Levels of chlorinated hydrocarbons and mixed function oxidase activity in antarctic organisms [1990, ita] **B-46131**
Metal contents in tissues of *Adamussium colbecki* and role of metallothioneins in detoxification of heavy metals [1990, ita] **B-46132**
Mercury and selenium in mollusca and fish from the Ross Sea [1991, eng] **B-46150**
Biogenic silica cycling in the upper waters of the Ross Sea [1991, eng] **B-46241**
Pesticides in fish from the Ross Sea [1992, eng] **B-46360**
Multiple sex-chromosome system in antarctic ice-fishes [1992, eng] **B-46835**
New and little-known Bryozoa from Antarctica [1991, eng] **B-46838**
Antarctic Mollusca, with special reference to the fauna of the Ross Sea [1990, eng] **B-46948**
Larval development of antarctic euphausiids [1992, eng] **B-47046**
Oneirodidae: Dreamers [1990, eng] **B-47091**
Melanocetidae: Devil-anglers [1990, eng] **B-47092**
Cardiovascular responses of two antarctic nototheniid fishes [1992, eng] **B-47337**
Late Cenozoic glacial history of the Ross Embayment [1991, eng] **E-45259**
High resolution seismic record of antarctic glacial history [1991, eng] **E-45321**
Structure and evolution of continental margins in the southern ocean [1991, rus] **E-45745**
Lithosphere research in the Ross Sea area, Antarctica: achievements and targets [1991, eng] **E-45783**
Cenozoic peralkaline magmatism in the Ross Sea [1991, eng] **E-45785**
Magnetic susceptibility of Ross Sea continental shelf [1991, eng] **E-45803**
Workshop on Ross Sea earth science research [1991, eng] **E-45884**
Seismic reflection survey of the Ross Sea continental shelf [1990, eng] **E-45907**
Seismic refraction surveys of the Ross Sea [1990, eng] **E-45908**
Magnetism and seismic reflection study in the Ross Sea [1990, eng] **E-45909**
Biogenic sediment fluxes in the western Ross Sea [1990, eng] **E-45998**
Biogeochemical fluxes in Ross Sea continental shelf sediments [1990, eng] **E-45999**
Deglacial sequences on the Victoria Land coast [1991, eng] **E-46490**
Antarctic ice volume related to sea level fall at 20,000 bp [1992, eng] **E-46641**
Clay minerals in antarctic waters [1992, eng] **E-47044**
Benthic foraminifera and glacio-eustatic and tectonic events [1988, eng] **E-47236**
Upper Oligocene-Holocene benthic foraminifera of the Ross Sea region [1988, eng] **E-47237**
Cenozoic sedimentary processes on the antarctic continental margin and the record from deep drilling [1992, eng] **E-47351**
Ozone level trends from moss specimens [1990, eng] **I-45603**
Antarctic mesocycle regimes from satellite and conventional data [1992, eng] **I-46087**
Tropospheric geochemistry at Terra Nova Bay [1992, eng] **I-47244**
Sea level tidal oscillations in the shelf area of Russkaya Station [1990, rus] **J-45245**
High salinity shelf water formation model [1991, eng] **J-45365**
Geochemistry of sediments in the western Ross Sea [1991, eng] **J-45819**
Biogenic silica in Ross Sea surface waters, 1990 [1990, eng] **J-45997**
Heavy metals in snow and sea water at Terra Nova Bay Station [1991, eng] **J-46147**
Trace metal determination in the Ross Sea [1991, eng] **J-46149**
Heavy metal distribution in the Ross Sea [1991, eng] **J-46162**
Organic compounds in sediments [1991, eng] **J-46169**
Biogenic silica and organic carbon in antarctic marine environments [1991, eng] **J-46243**
Chlorophyll and primary productivity in the Ross Sea in summer 1990 [1990, eng] **J-46261**
Silicon as a limiting nutrient to antarctic diatoms [1992, eng] **J-46804**
Chlorofluorocarbon evidence for rapid ventilation of the Ross Sea [1991, eng] **J-46915**
Acquisition, processing and preliminary results of the Antarctic 1987-88 geophysical survey [1988, eng] **L-45708**
1988/89 Italian antarctic geophysical survey [1991, eng] **L-45802**
LIRA: lithospheric investigations in the Ross Sea area [1991, eng] **L-45886**
Phased peridotites from a continental rift system [1992, eng] **L-46768**

Rothera Point
Short-offset seismic refraction results near Rothera Station, Antarctic Peninsula [1992, eng] **F-47332**

Royds, Cape
Growth of Adélie penguin rookery at Cape Royds, 1955-1990 [1991, eng] **B-46846**

Russkaya Station
Ice drifting properties in the Russkaya Station region [1990, rus] **F-45243**
Morphologic properties of the Pacific ice massif [1990, rus] **F-45247**
Climate of West Antarctica [1990, rus] **I-45644**

Rutford Ice Stream
Grounding zone of Rutford Ice Stream, Antarctica [1986, eng] **F-45492**
Glaciological study of the Rutford Ice Stream [1986, eng] **F-45494**
Surface undulations where Rutford Ice Stream enters Ronne Ice Shelf [1990, eng] **F-45516**

Saint Johns Range
Deformation in the Saint Johns Range [1991, eng] **E-45869**

Saint Johns Range *(cont.)*
Basement granitoids of the Saint Johns Range [1991, eng] **E-45870**
Saint Paul Island
Additional data on subantarctic ichthyofauna of the French southern islands [1982, fre] **B-45709**
Sanae Station
Newsletter/Nuusbrief, No.507, June 1991 [1991, eng] **A-46964**
Newsletter/Nuusbrief, No.509, Aug. 1991 [1991, eng] **A-46965**
Newsletter/Nuusbrief, No.510, Sep. 1991 [1991, eng] **A-46966**
Newsletter/Nuusbrief, No.514, Jan. 1992 [1992, eng] **A-46967**
Newsletter/Nuusbrief, No.515, Feb. 1992 [1992, eng] **A-46968**
Newsletter/Nuusbrief, No.516, Mar. 1992 [1992, eng] **A-46969**
Newsletter/Nuusbrief, No.517, Apr. 1992 [1992, eng] **A-46970**
Newsletter/Nuusbrief, No.518, May 1992 [1992, eng] **A-47163**
Newsletter/Nuusbrief, No.500, Nov. 1990 [1990, eng] **A-47207**
Schirmacher Hills
Plasmids in antarctic soil bacteria [1991, eng] **B-45339**
New psychrotrophic bacterium from Schirmacher Hills [1992, eng] **B-46058**
Extracellular protease from the antarctic yeast *Candida humicola* [1992, eng] **B-46608**
Stable isotope geochemistry of antarctic salt efflorescences [1990, eng] **E-45598**
Atmospheric ions and Aitken particles over polar regions [1992, eng] **I-47308**
Schirmacher Ponds
Deciphering recent structures and Holocene evolution of the marginal East Antarctic ice cover [1991, eng] **F-46649**
Scotia Sea
Surface layer sea ice assemblages, Weddell and Scotia Seas [1991, eng] **B-45344**
Carbon cycling during ice retreat in the Scotia-Weddell Seas area [1991, eng] **B-46228**
Production of biogenic silica in the Weddell and Scotia Seas [1991, eng] **B-46240**
Plankton physiology in the Weddell and Scotia Seas [1992, eng] **B-46379**
Nanophytoplankton composition in the Weddell-Scotia Confluence area [1992, eng] **B-46380**
Loricate choanoflagellates of the southern ocean [1992, eng] **B-46381**
Sexual development of krill in the Scotia-Weddell region [1992, eng] **B-46382**
Top predators of the confluence and marginal ice zones [1992, eng] **B-46385**
Ice edge phytoplankton blooms, Weddell-Scotia Seas [1992, eng] **B-46413**
Protozooplankton at the ice edge zone of the Weddell and Scotia Seas [1992, eng] **B-46635**
Species composition changes of armored dinoflagellates [1991, eng] **B-46818**
Increases in penguin population related to sea ice cover changes [1992, eng] **B-46820**
Euphausia superba in the antarctic marginal ice zone [1991, eng] **B-46841**
Distribution of Euphausiid larvae in the Weddell Gyre in Sep.-Oct. 1989 [1992, eng] **B-47029**
Larval development of antarctic euphausiids [1992, eng] **B-47046**
Structure and evolution of continental margins in the southern ocean [1991, rus] **E-45745**
Tectonic development of the Scotia arc region [1991, eng] **E-46340**
Biogenic silica in the Weddell-Scotia Seas [1991, eng] **J-45407**
Winter Weddell Gyre Study, 1989 [1990, eng] **J-46002**
Nitrogen dynamics in the Scotia-Weddell Confluence [1991, eng] **J-46100**
Water column structure and evolution in the Scotia-Weddell Sea [1991, eng] **J-46212**
Barite formation in the southern ocean water column [1991, eng] **J-46237**
Dissolved Al at the Weddell-Scotia Confluence [1991, eng] **J-46238**
Biogenic silica and organic particulates, Weddell/Scotia Seas [1991, eng] **J-46239**
Measurements of southern ocean productivity [1991, eng] **J-46286**
*V*N-15O3 uptake in HNLC areas [1991, eng] **J-46288**
Suspended matter in Scotia-Weddell Confluence, 1988 [1992, eng] **J-46378**
Krill diet affects faecal string settling [1992, eng] **J-46383**
Krill faecal material and particle flux [1992, eng] **J-46384**
Scott Base
Accidental case of raw sewage pollution [1992, eng] **B-46580**
Effects of exposure to diesel fuel oil on fish [1992, eng] **B-47127**
Sky irradiance and UV effects of the ozone hole, 1990 [1992, eng] **I-45876**
Intensity and polarization of skylight in a high albedo environment [1992, eng] **I-45877**
Large-scale waves in the antarctic mesosphere [1992, eng] **I-46874**
Tropospheric alkanes and acetylene long-term measurements [1992, eng] **I-47239**
Ionisation in the antarctic stratosphere [1992, eng] **K-45979**
Sessrumnir Valley
Surficial geology of Sessrumir Valley and implication for ice sheet overriding [1990, eng] **E-45904**
Subglacial meltwater system, Sessrumir Valley [1990, eng] **E-45905**
Severnaya Zemlya
Daily variations in the snow surface roughness parameter [1990, rus] **F-46109**
Seymour Island
Possible new brachiopod from Seymour I. [1991, eng] **B-45755**
New marsupiate cidaroid echinoid from the Maastrichtian of Antarctica [1991, eng] **E-45229**
Palynology and stratigraphy of new Cretaceous-Tertiary boundary section from Seymour I. [1990, eng] **E-45839**
Placental mammal from the Eocene of West Antarctica [1992, eng] **E-45858**
Eocene wrasse from Seymour I. [1992, eng] **E-46372**
James Ross Basin workshop [1992, eng] **E-46373**
Molluscan biostratigraphy, La Meseta Formation, Seymour I. [1992, eng] **E-47299**
Carbon and oxygen isotope record in the Paleogene La Meseta Formation [1992, eng] **E-47329**
Shackleton Range
High pressure complex of the Shackleton Range [1992, eng] **E-46738**
Further evidence for a glacial maximum in Antarctica during the Late Neogene [1992, eng] **E-47354**
Shag Rocks
Fishery for *Patagonotothen brevicauda guntheri* in CCAMLR Subarea 48.3 [1991, eng] **B-45425**
Areas of seabed within selected depth ranges in CCAMLR Subarea 48.3, South Georgia [1991, eng] **J-45436**
Showa Station
JARE-31 wintering party activity at Showa in 1990 [1992, jpn] **A-46751**
Programs of JARE-32 in 1990-1992 [1991, jpn] **A-47016**
Zooplankton collected during JARE-23 at Showa Station, Stn. 5 [1992, eng] **B-46592**
Culture of a moss from a lake near Showa Station [1992, eng] **B-47034**
Geochemical characteristics of antarctic lakes and ponds [1992, eng] **B-47035**
Aquatic mosses from lakes near Showa Station [1992, eng] **B-47042**
Seasonal and annual changes of Adélie penguin colonies [1992, jpn] **B-47344**
MOS-1 multi-sensor data set for sea ice monitoring [1991, eng] **F-46501**
Snowfall and snow clouds at Showa Station [1992, eng] **F-46555**
Z-R relation for graupels and aggregates at Showa Station [1992, eng] **F-46556**
Multi-sensor data set and sea ice study [1992, jpn] **F-46904**
MOS-1 data received at Showa Station [1990, jpn] **F-47316**
Satellite data receiving system at Showa Station [1991, eng] **G-45961**
Changes in JARE-30 wintering members in 1988-1990 [1991, jpn] **H-45184**
JARE-30 Polar Patrol Balloon experiment, 1989-1990 [1991, eng] **I-45179**
Observations of the ozone hole by the Polar Patrol Balloon in 1991 [1991, eng] **I-45182**
Backscattering from aerosols in polar atmospheric clouds [1991, eng] **I-45611**
Cloud distribution in the Antarctic from AVHRR data and radiation measurements at the surface [1992, eng] **I-45619**
Seasonal change and chemical state of polar stratospheric aerosols [1991, eng] **I-46045**
Atmospheric methane measurements at Showa Station [1992, eng] **I-46552**
Atmospheric carbon dioxide at Showa Station, 1984-1988 [1992, eng] **I-46553**
Analysis of MOS-1 MSR data received at Syowa Station, Antarctica [1992, eng] **I-46564**

Preliminary study of katabatic wind by using NOAA AVHRR data [1992, eng] I-46565
PPI radar data at Showa Station, Feb.-Dec. 1989 [1992, eng] I-46593
Antarctica from NOAA satellites. Clouds, ice and snow [1992, eng] I-46595
Extension of antarctic ozone hole to lower latitudes in the South-American region [1991, eng] I-46719
JARE-30 meteorological observations at Showa Station [1991, jpn] I-46742
Meteorological data at Showa Station, 1989 [1992, eng] I-46899
Meteorological data at Showa and Asuka stations, 1990 [1992, eng] I-46900
Tropospheric ozone concentrations over Showa Station [1992, eng] I-47240
Atmospheric methane at Showa Station [1992, eng] I-47241
Lidar measurement of stratospheric aerosols [1985, eng] I-47374
Mean sea level at Showa Station [1991, eng] J-46194
Oceanographic data of the 31st Japanese Antarctic Research Expedition from Nov. 1989 to Mar. 1990 [1992, eng] J-46464
Seasonal sea-level variation at Syowa Station [1992, eng] J-46903
CNA pulsations associated with geomagnetic sudden commencements [1991, eng] K-45371
Conjugacy of CNA pulsations and their source movement in the auroral zones [1991, eng] K-45372
Upper atmosphere physics data, Syowa and Asuka Stations, 1989 [1992, eng] K-46181
HF field strength at Showa Station in 1988 [1991, eng] K-46463
Radio aurora at Showa Station, 1990 [1992, eng] K-46465
30 MHz cosmic noise at Showa Station in 1990 [1992, eng] K-46466
Apparent lifetime of auroral 630.0 nm (OI) emissions [1992, eng] K-46675
Estimation of geomagnetic conjugate points by using Pc5 pulsations [1992, jpn] K-46747
D-region electron density diurnal changes [1992, eng] K-46810
Antarctic radio telescope for atmospheric chemistry and radio astronomy [1992, eng] K-47177
Near-real time data from Showa for space weather forecast [1992, eng] K-47178
Polarization of irregular pulsations of diminishing period [1992, eng] K-47301
Energy parameters of incident auroral electrons [1992, jpn] K-47338
Characteristics of 30-MHz interference noises observed by riometers [1992, jpn] K-47339
Earthquake activity around Showa Station [1991, eng] L-45323
Polar patrol balloon magnetic field survey [1991, eng] L-45880
Seismological bulletin of Syowa Station, Antarctica, 1990 [1992, eng] L-46180
Microseismic activities around Showa Station [1991, eng] L-46192
Three-component broadband digital seismograph at Showa Station [1991, jpn] L-46743

Signy Island
Variations in an antarctic limpet [1991, eng] B-45605
Drying processes in an antarctic collembolan [1991, eng] B-45818
Survival and growth of antarctic terrestrial algae [1991, eng] B-45879
Fine structure of a terrestrial cyanobacterial mat [1992, eng] B-46185
Reproductive strategies of two antarctic rotifers [1992, eng] B-46605
Ecophysiological study of brown algae from Signy Island [1992, eng] B-46770
Water-loss and anhydrobiotic survival in nematodes of antarctic fellfields [1991, eng] B-46954
Seasonal periodicity of algae on antarctic fellfield soils [1991, eng] B-46958
Reproduction and larval growth of *Harpagifer antarcticus* Nybelin [1992, eng] B-47324
Mechanical weathering in the Antarctic: a maritime perspective [1992, eng] E-47268
Precipitation nitrogen at Signy I. and Cape Bird [1992, eng] I-46834

Signy Station
Population structure and transmission of *Escherichia coli* in man [1991, eng] H-45872

Siple Coast
Variations in the flow of ice stream B [1990, eng] F-45912
Ice stream B on deforming bed [1990, eng] F-45913
Geophysical experiments in ice stream B boreholes [1990, eng] F-45914
Analysis of radar data [1990, eng] F-45917

Siple Station
Spatial and temporal characteristics of the Little Ice Age: the antarctic ice core record [1991, eng] F-46041
Global carbon cycle models and atmospheric CO2 [1992, eng] I-46418
Case study of plasma structure in the dusk sector associated with enhanced magnetospheric convection [1992, eng] K-46976
VLF propagation in the antarctic earth-ionosphere waveguide [1992, eng] K-47264
Three dimensional ray tracing of whistler mode waves [1985, eng] K-47375

Sör Rondane Mountains
Biological surveys in the Sör Rondane Mountains, 1989 and 1990 [1991, eng] B-45183
Polar-wander path for Precambrian to Cambro-Ordovician from Mt. Nils Larsen [1991, eng] E-46199
Glacial history of the central Sör Rondane Mountains [1991, eng] E-46202
Ammonium content of biotites in Sör Rondane Mountains rocks [1991, eng] E-46203
Rock age determination in the Sör Rondane Mountains [1991, eng] E-46204
JARE-32 fieldwork in Sör Rondane Mountains [1991, jpn] E-46744
Late Cenozoic of western Sör Rondane Mountains [1992, jpn] E-46748
Model of the rate of frost shattering: application to field data from Japan, Svalbard and Antarctica [1991, eng] E-46798
Bare ice fields developed in the inland part of Antarctica [1992, eng] F-46560

South Atlantic Ocean
Krill fishing activity in the southwest Atlantic [1991, eng] B-45218
Functional division of *Electrona carlsbergi* habitat relative to latitudinal zonation of the southern ocean [1991, eng] B-45431
Acoustic surveys of myctophid biomass in the South Atlantic [1991, eng] B-45434
Satellite tracking of wandering albatrosses [1992, eng] B-45850
Spatial dispersion patterns of antarctic seabirds [1988, eng] B-46912
Winter Weddell Gyre study of krill, 1989 [1992, eng] B-47030
Lipids and Omega 3 series concentrations in fatty acids of antarctic krill [1989, spa] B-47161
Bycatch of fish in the South Atlantic krill fishery [1992, eng] B-47319
Stable isotope ratios of POC from the South Atlantic sector [1991, eng] J-46248

South Georgia
Shackleton Valley, South Georgia [1992, eng] A-46731
Was Shackleton Valley the passageway to Stromness [1992, eng] A-46732
Shackleton's landing at King Haakon Bay, South Georgia, 1916 [1992, eng] A-46735
Diving patterns and performance of the antarctic blue-eyed shag [1991, eng] B-45095
Multispecies seabird flocks around South Georgia [1991, eng] B-45261
Digestive enzymes in a South Georgia I. beetle [1991, eng] B-45343
Distribution and biomass of krill fishery around South Georgia [1991, eng] B-45417
Demersal fish surveys at South Georgia, Jan.-Feb. 1990 [1991, eng] B-45422
Toothfish, *Dissostichus eleginoides,* at South Georgia [1991, eng] B-45423
Fishery for *Patagonotothen brevicauda guntheri* in CCAMLR Subarea 48.3 [1991, eng] B-45425
Age determination of *Champsocephalus gunnari* Lönnberg, 1905 at South Georgia [1991, eng] B-45426
Trawl bag selectivity in the *Champsocephalus gunnari* fishery [1991, eng] B-45427
Natural mortality rate of *Champsocephalus gunnari,* South Georgia [1991, eng] B-45428
Fishing standardization for *Champsocephalus gunnari* at South Georgia [1991, eng] B-45429
Food consumption by predators in a CCAMLR Integrated Study Region [1991, eng] B-45439
Variations in an antarctic limpet [1991, eng] B-45605
Fish parasites in the Antarctic and near South Georgia [1991, eng] B-45733
Seabird species abundance and sea surface temperature changes [1992, eng] B-45848
Parasite infection of fish at South Georgia [1992, eng] B-45853
Demersal fish communities of South Georgia [1991, eng] B-45934
Diet, feeding behavior, and morphology of an antarctic echinoderm [1991, eng] B-46101

South Georgia *(cont.)*
Phytoplanktonic nitrogen assimilation near South Georgia and in Bransfield Strait [1991, eng] **B-46227**
Population structure of cephalopods in the subantarctic South Atlantic [1991, eng] **B-46300**
Composition of zooplankton from the southern ocean [1992, eng] **B-46306**
Acanthocephalan infection in fish at South Georgia [1992, eng] **B-46367**
Winter diet of Gentoo Penguins at South Georgia [1991, eng] **B-46470**
Taxonomy of *Gobionotothen angustifrons sandwichensis* [1992, eng] **B-46477**
Anatomy and histology of *Notothenia rossi marmorata* [1992, eng] **B-46478**
Winter diving in Gentoo penguins [1992, eng] **B-46671**
Lichen genus *Stereocaulon* in Antarctica and South Georgia [1991, eng] **B-46813**
Survival of sub-zero temperatures by two South Georgian beetles (Coleoptera, Perimylopidae) [1992, eng] **B-46828**
New and little-known Bryozoa from Antarctica [1991, eng] **B-46838**
Ecology of an exploited antarctic fish community [1990, eng] **B-46911**
Migration and feeding of copepods near South Georgia [1992, eng] **B-46940**
Larval development of antarctic euphausiids [1992, eng] **B-47046**
Research, exploitation, and conservation of antarctic fishes [1990, eng] **B-47060**
Feeding and migration of copepods near South Georgia [1992, eng] **B-47136**
Distributions and predator-prey interactions near Bird Island [1992, eng] **B-47290**
Abundance and distribution of fish larvae in spring and summer at South Georgia [1992, eng] **B-47322**
Reproductive ecology of the antarctic bivalve *Lissarca notorcadensis* (Philobryidae) [1992, eng] **B-47365**
Glacier fluctuations on South Georgia during the 1970s and early 1980s [1992, eng] **F-46370**
Areas of seabed within selected depth ranges in CCAMLR Subarea 48.3, South Georgia [1991, eng] **J-45436**
British dependent territories in antarctic regions [1992, eng] **M-47172**

South Orkney Islands
Review of *Pariphimedia* and redescription of the two antarctic species [1991, eng] **B-45094**
Effect of sea ice on krill population structure around Elephant and South Orkney Is. [1991, eng] **B-45317**
Differences in target strength of krill swarms at 38 and 120 kHz [1991, eng] **B-45414**
Krill biomass assessment in Area 48, fall 1989-1990 [1991, eng] **B-45416**
Spatial dispersion of seabirds near the South Orkney Islands and the Weddell-Scotia Confluence [1992, eng] **B-46832**
Reproductive ecology of the antarctic bivalve *Lissarca notorcadensis* (Philobryidae) [1992, eng] **B-47365**
Antarctic climate manifestations from observations on South Orkney Is. [1990, spa] **I-45131**
Total organic carbon in the antarctic sea ice zone, 1988-89 [1991, eng] **J-46221**
Sediments and bottom currents in the northwestern Weddell Sea [1992, ger] **J-47372**

South Pacific Ocean
Morphologic properties of the Pacific ice massif [1990, rus] **F-45247**
Spatial and temporal variability of ice concentration in the South Pacific Ocean [1990, rus] **F-45248**
Sea ice influence on the development of a cyclone in Antarctica [1990, spa] **I-45128**
Atmospheric and ice conditions in the Pacific Ocean, 1985-1986 [1990, rus] **I-45673**
Temperature, salinity and geostrophic flow of the South Pacific Ocean [1992, eng] **J-47038**
Effects of ridge crest-trench interaction on Antarctic-Phoenix spreading [1991, eng] **L-45167**

South Sandwich Islands
Krill biomass assessment in Area 48, fall 1989-1990 [1991, eng] **B-45416**
Diet, feeding behavior, and morphology of an antarctic echinoderm [1991, eng] **B-46101**
Taxonomy of *Gobionotothen angustifrons sandwichensis* [1992, eng] **B-46477**
British dependent territories in antarctic regions [1992, eng] **M-47172**

South Shetland Islands
Declining abundance of *Notothenia rossii marmorata* and *N. gibberifrons* off South Shetland Is. [1991, eng] **B-45424**
Thaumatelsonella kingelepha, a new genus and species from Antarctica (Crustacea:Amphipoda:Gammaridea:Stenothoidae) [1991, ger] **B-45622**
Fish parasites in the Antarctic and near South Georgia [1991, eng] **B-45733**
Nano- and microalgae in adjacent waters of Antarctica. 2 [1991, chi] **B-46444**
Circumcontinental distribution of antarctic plunderfish [1992, eng] **B-46480**
Amphipods from the South Shetland Is. [1988, fre] **B-46845**
Nannoniscus bidens Vanhöffen, 1914 from West Antarctica [1992, eng] **B-46876**
Myxinidae: Hagfishes [1990, eng] **B-47063**
Spanish-Argentine antarctic geodynamic GPS network project [1990, eng] **C-45145**
Volcanic rocks of the Antarctic Peninsula, the South Shetlands and South America [1991, eng] **E-45326**
Late Holocene tephrochronology of the northern Antarctic Peninsula [1991, eng] **E-45488**
Antarctic fjord sedimentation [1990, eng] **E-45906**
Evolution of the South Shetland margin and the Bransfield Strait [1990, spa] **E-46944**
Clay minerals in surface sediments in Bransfield Strait [1992, eng] **E-47362**
Summer oxygen-minimum layer in waters adjacent to the South Shetland Is. and Ardley I. [1991, eng] **J-46854**
Circulation and temperature models for effects on krill larvae development and distribution [1989, eng] **J-47114**
Upper ocean thermal structure off the northwestern Antarctic Peninsula [1992, eng] **J-47144**
Effects of ridge crest-trench interaction on Antarctic-Phoenix spreading [1991, eng] **L-45167**

Spitsbergen
Spores and pollen from the glaciers and periglacial zone of the Arctic and Antarctica [1991, rus] **E-46994**

Stansbury Peninsula
Volcanology and petrology of the Stansbury Peninsula [1991, chi] **E-45467**

Stonington Island
Antarctic global warming [1992, eng] **F-45686**

Suffield Point
Tide observations at Suffield Point [1989, spa] **J-47154**

Taylor Valley
Epilithic lichens on the floor of the Taylor Valley [1992, eng] **B-46069**
Factors affecting the distribution of yeasts in the Antarctic Ross Desert [1987, eng] **B-46909**
Evolution of granitoids from south Victoria Land [1992, eng] **E-45856**
Segregation of leucogranite plutons during deformation [1992, eng] **E-46769**
Low pressure/high temperature metamorphism of Koettlitz Group schists [1992, eng] **E-46977**

Terra Nova Bay
Nudibranch molluscs from the Ross Sea [1991, eng] **B-45394**
Proceedings of the 1st Meeting on Biology in Antarctica, Rome, Italy, CNR, June 22-23, 1989 [1990, ita] **B-46112**
State of the art of lichenology in Antarctica [1990, ita] **B-46113**
Karyology of some antarctic marine invertebrates [1990, ita] **B-46123**
Genetic structure of endoparasitic nematodes and their hosts; adaptive processes [1990, ita] **B-46124**
Adamussium colbecki and heavy metals in the Ross Sea [1990, ita] **B-46133**
Satellite image mosaic of the Terra Nova Bay area [1991, eng] **C-45799**

- Lithospheric transect, Antarctic Peninsula—South Shetland Is. [1990, eng] **E-45148**
- Evidence for a dynamic West Antarctic Ice Sheet history [1991, eng] **E-45269**
- Antarctic volcanic hazard [1991, eng] **E-45324**
- Geophysical studies of the west antarctic rift system [1991, eng] **E-45403**
- West antarctic rift system and Cenozoic climate change [1990, eng] **E-45820**
- West antarctic rift system: a review of geophysical investigations [1991, eng] **E-46175**
- Basal stress distribution of ice stream E, Antarctica inferred by control methods [1992, eng] **F-45447**
- West Antarctic Ice Sheet [1991, eng] **F-45479**
- Internal layering and bedrock topography of ice stream C [1990, eng] **F-45915**
- Analysis of seismic data from ice stream C [1990, eng] **F-45916**
- Microearthquakes as indicators of ice stream basal conditions [1990, eng] **F-45978**
- On the pulling power of ice streams [1992, eng] **F-46496**
- Search for temporal changes in the velocity of Ice Stream B, West Antarctica [1992, eng] **F-46497**
- Ice Stream B: motion and interaction with climate [1991, eng] **F-46655**
- Coherent Antarctic Radar Depth Sounder (CARDS) design, development and results [1989, eng] **F-46999**
- Climate of West Antarctica [1990, rus] **I-45644**
- Has European cooperation begun in Antarctica [1990, rus] **I-46110**
- Cs-137 contamination of the antarctic ecosystems [1990, spa] **J-46698**
- Early diagenesis and biogeochemistry of iodine in west antarctic ocean [1992, chi] **J-46938**
- Burst particle precipitation on VLF signals [1991, eng] **K-46952**
- Deep crustal structure from seismic refraction modelling in West Antarctica [1990, eng] **L-45147**
- Earth crust and effective topography of Antarctica [1989, rus] **L-45253**
- Structure and development of the antarctic Earth's crust [1990, eng] **L-45892**
- Configuration and structure of the subglacial crust [1991, eng] **L-46343**

Whitmore Mountains
- Late Gondwanide tectonic rotations within Gondwanaland [1992, eng] **E-46806**

Wideröe, Mount
- Explanatory text of geological map of Wideröefjellet, Sör Rondane Mountains, Antarctica [1992, eng] **E-47376**

Wilkes Land
- Krill resources and distribution off Wilkes Land, 1986-1989 [1991, eng] **B-45418**
- Microbial mineralization in soils and plant material from Antarctica [1991, eng] **B-46033**
- Continental margins of the Red Sea with a comparison to Wilkes Land [1991, eng] **E-46982**
- Ultratrace determination of cadmium in polar snow and ice [1991, eng] **F-45236**
- Stable isotope results, Wilkes Land Oceanographic Expedition, 1985 [1990, eng] **J-46001**

Wiman, Cape
- Eocene microplankton from La Meseta Formation, northern Seymour Island [1992, eng] **E-46885**

Windmill Islands
- Adélie penguins on Windmill Is. [1991, eng] **B-46468**
- Bryophyte physiology after leaching and freeze-thaw cycles [1992, eng] **B-47321**

Polyol and sugar content of terrestrial plants from continental Antarctica [1992, eng] **B-47323**
Lakes on Windmill Is. and paleolimnology [1991, eng] **E-46488**

Wohlthat Mountains
Landscape evaluation of Wohlthat Mountains [1991, eng] **E-46030**

Wordie Ice Shelf
Antarctic global warming [1992, eng] **F-45686**
Breakup of Wordie Ice Shelf, Antarctica [1991, eng] **F-46657**

Wright Valley
Exposure ages and erosion rates for bedrock samples from dry valleys [1990, eng] **E-45826**
Geothermometry of Koettlitz Group metasediments in the Wright Valley [1992, eng] **E-46861**

Yukon TerritoryFirth River
Glacier, river and sea ice blister observations [1992, eng] **F-47213**
Parameters which influence the air content in polar ice [1992, eng] **I-47047**

Zhongshan Station
Ecology of *Catharacta maccormicki* near Zhongshan Station [1991, chi] **B-46452**
Feeding habit of the south polar skua around Zhongshan Station, East Antarctica [1992, chi] **B-46890**
Radiation data at Zhongshan Station, Feb. 1990-Jan. 1991 [1991, chi] **I-46439**
Radiation balance components over Larsemann Hills [1991, chi] **I-46445**
Solar radiation at Zhongshan Station [1991, chi] **I-46454**
Influences of solar flare bursts and particle precipitations on the polar lower ionosphere [1992, chi] **K-46894**
